# LM PCI: Why is it such a big issue?

- Because...

- the myocardial jeopardy is extensive and does not leave much room for fault consequences.
- it can be technically challenging.
- it demands proper planning and substantial expertise.
- it operates within the 'dark gray zone' of current revascularization guidelines (Class IIb indication).

# Anatomic variations

Ostial stenosis

Mid shaft stenosis

Distal stenosis

# Impact on prognosis

- Co-Morbidity

- Elderly patient
- LV Function
- Associated valvular pathology
- Emergent presentation
- Shock
- Diabetes mellitus
- Renal dysfunction
- ↑ EuroScore
- ↑ SYNTAX Score

# Left main complexities

Calcified  
>50% of cases

The image shows a 3D reconstruction of a left main coronary artery bifurcation. The main trunk is on the left, and it branches into two vessels on the right. The vessel walls are rendered in a semi-transparent, textured style, showing internal structures and calcifications. Three callout boxes with white borders and black text provide statistical data: 'Calcified >50% of cases' points to a yellowish, irregular area on the upper branch; 'Concomitant MVD >70% (↑SYNTAX Score)' points to a similar area on the lower branch; and 'Distal LM location ~70% of cases' points to the main trunk of the artery.

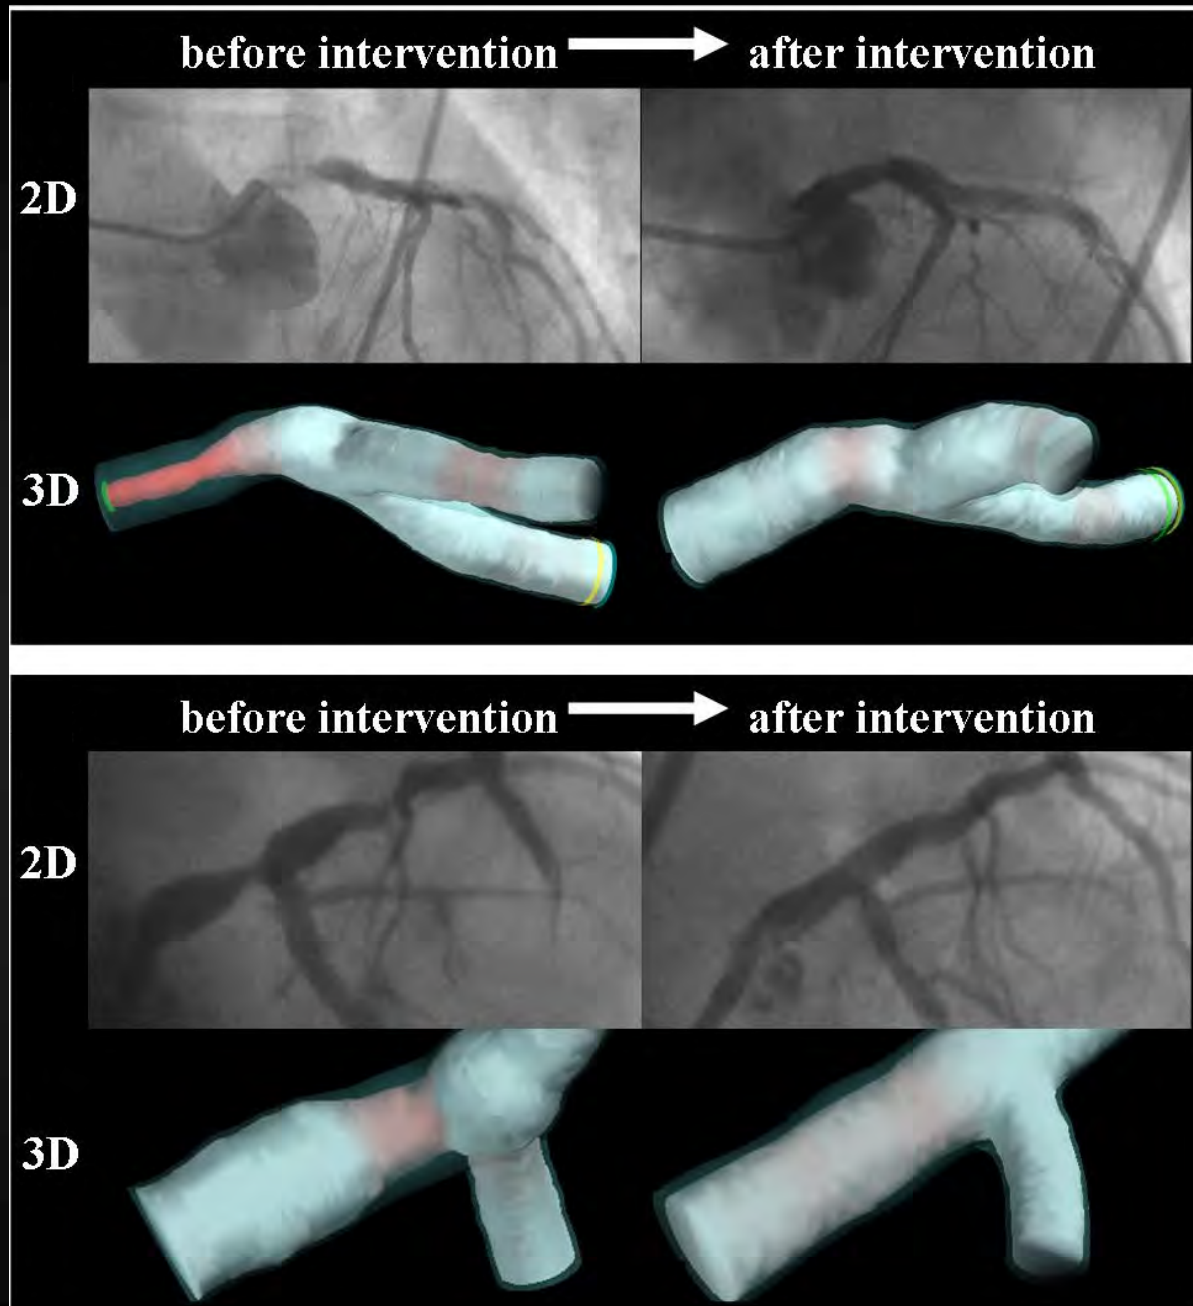

Concomitant  
MVD >70%  
(↑SYNTAX Score)

Distal LM location  
~70% of cases

# Left Main assessment: *Imaging Modalities*

# Left Main 3D Angio

# Fundamental issues

- CABG vs. PCI
- Procedural safety and effectiveness
- PCI planning is mandatory
- Long-term consequences

# Favorable vs. Unfavorable LMD for PCI

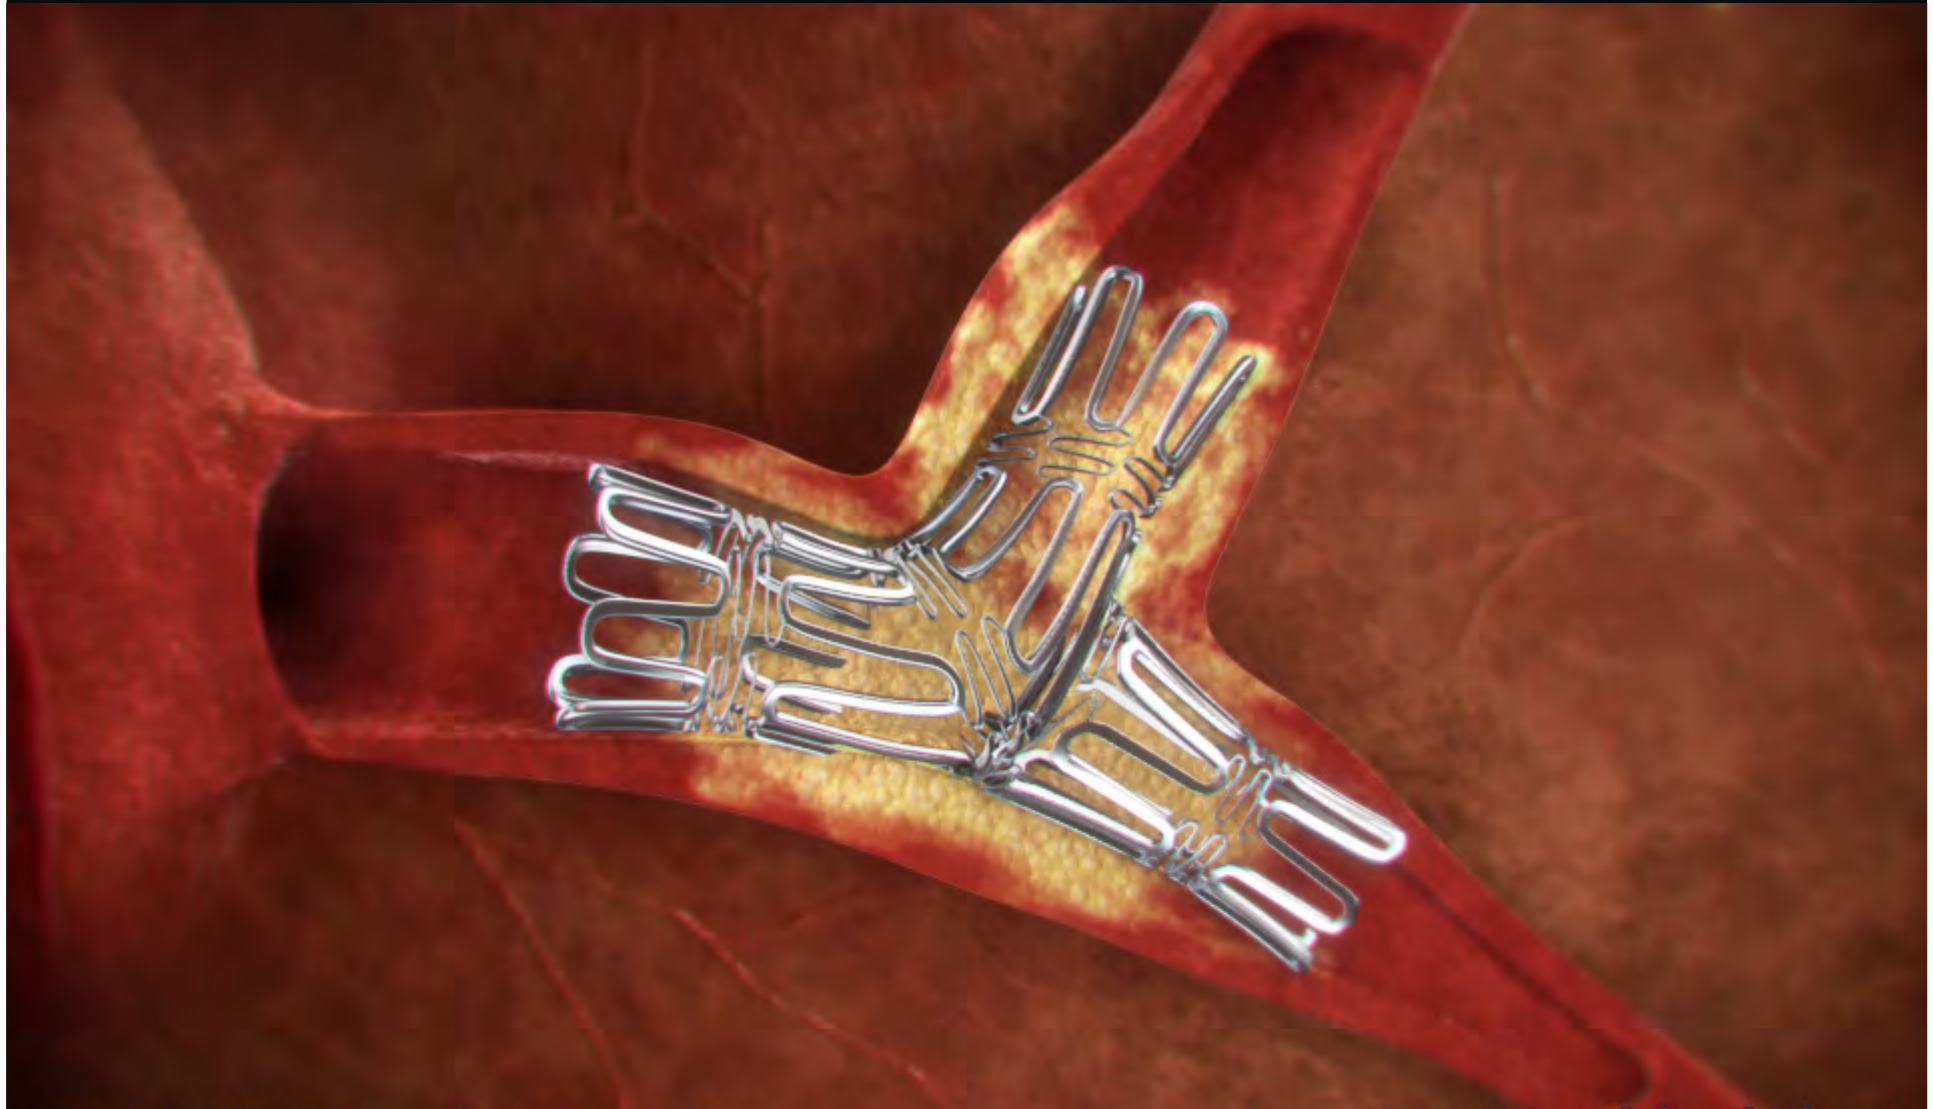

## Favorable for PCI

- Ostial LMD
- Mid shaft LMD
- Isolated LMD
- LM diameter  $\geq 3.5$ mm
- Patent RCA
- No/mildly calcified
- Good LV function

## Problematic for PCI

- Distal LM
- Ostial LAD/LCX involvement
- Sharp LAD/LCX angles
- Heavy calcification
- LM diameter  $< 3.5$  mm
- Associated MVD
- Occluded RCA
- Poor LV function
- Associated valve pathology

# PCI Strategies

# PCI Considerations in Left Main PCI

- Strategies in PCI

- Direct vs. Non-direct stenting
- Need for lesion debulking (+/-)
- Bifurcation techniques

- Adjunctive technologies

- Intravascular ultrasound
- Directional or Rotational atherectomy
- DES vs. BMS

- Late outcome

- Long-term Clopidogrel or Prasugrel administration
- Repeat angiography or cardiac CTA

# Ostial LM Stenting

- Debulking or cutting?
  - Calcification
- Stent positioning
- DES vs. BMS?
- Optimal expansion
  - IVUS Guidance

# Ostial and mid LM Stenting

# Diffuse-calcified LM stenosis

# Challenges in distal LM stenting

- Major determinants of procedural success:
  - Vessels diameters (LM and LAD/LCX)
  - Angle between LM to LAD/LCX
  - Presence of an intermediate branch
  - Plaque distribution
  - Plaque composition and amount of calcification
  - Potential for plaque shifting
  - Need for lesion “preparation”

# Distal LM stenting during STEMI

# Distal LM stenting @trifurcation

# Distal LM Stenosis

# Complex Distal LM stenting

# LM Equivalent disease

# LM Equivalent disease treated using the 'mini-crush' technique

# Ostial LAD involving distal LM (IVUS)

# Stenting the LM into the ostial LAD

# Long-term considerations

- Plavix vs. Prasugrel and for how long?
- Platelets inhibition tests?
- How to follow?
  - Symptoms driven?
  - Functional tests? SPECT? Stress echo?
  - Repeat angiography? When?
  - Cardiac CTA? When?

and Seung-Jung Park, M.D.

“In a cohort of patients with unprotected LMCA disease, we found no significant differences in rates of death or of the composite endpoint of death, Q-wave MI or stroke between patients receiving stents and those undergoing CABG. However, stenting even with DES was associated with higher rates of TVR than was CABG.”

Seung et al, NEJM 2008

# Unprotected LM PCI results @RMC

- 102 pts with UPLM stenting @RMC between 2006–2009
  - age  $74 \pm 12$  yrs
  - 64% male
  - 34% diabetics
  - 72% ACS
  - 45% distal LM disease
  - EuroScore=7.2%
  - 65% rate of DES use
  - 100% angio success

# SYNTAX Trial – MACCE to 2 Years

LM Cohort – Revasc in 60 patients from PCI Arm

■ CABG (n=348)

■ TAXUS™ Stent (n=357)

Time to event analysis; log-rank *P* value

ST=stent thrombosis; GO=graft occlusion

# Baseline LM Bifurcation Stenting Techniques Requiring Re-treatment

*LM Distal PCI (n=20 lesions)*

→ 5/20 (25%) lesions originally treated with 1 stent  
15/20 (75%) originally treated with 2 or 3 stents

Bar graphs represent percent of baseline treated lesions

# SYNTAX Le Mans: TAXUS results

- Angiography for 271 SYNTAX LE MANS pts at 15±1 mos
- Primary Endpoints: **Rate of long-term patency of treated LMD by QCA**

Primary Endpoint:

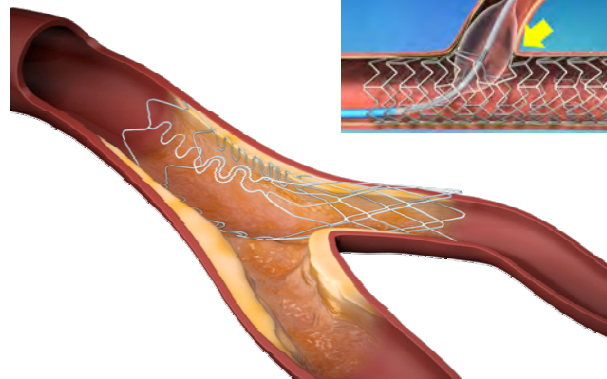

47/48

87/97

# DES Type

# Dedicated LM bifurcation techniques?

# Left Main PCI

Techniques, devices and operators!

- Left main is a PCI territory in suitable cases and by very experienced operators.
- Careful attention should be given to case selection, comprehensive clinical judgment and excellent PCI technique.
- Always do it for the patient!
