

CardioNeuroAblation

update July 2024

Lorin Schwartz MD

- > Trigger
- > Decrease in LV filling (tilt test)
- > Afferent receptor activation and
- > Initial increase in sympathetic outflow
- > Vigorous LV contraction (underfilled LV)
- > Rebound **reduction in sympathetic activity**
- > Leaving unopposed parasympathetic activity
- > Vasodilatation and/or bradycardia
- > **SYNCOPE.....**

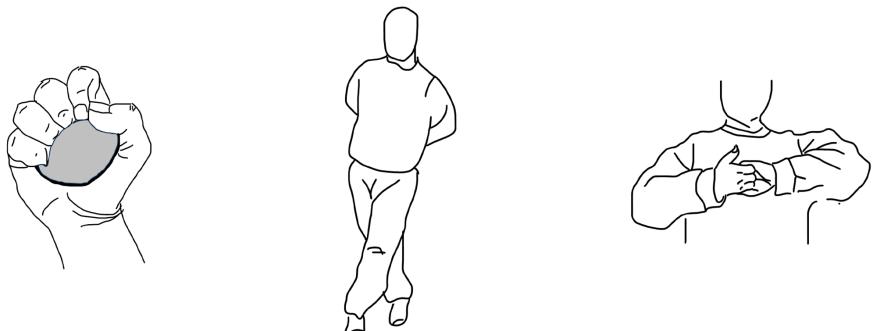

Modified from Braunwald's "Heart Disease" book

Cardiac pacing

Cardiac pacing should be considered to reduce syncopal recurrences in patients aged >40 years, with spontaneous documented symptomatic asystolic pause(s) >3 s or asymptomatic pause(s) >6 s due to sinus arrest, AV block, or the combination of the two.^{184,185,200,292}

IIa	B
IIa	B

Cardiac pacing should be considered to reduce syncope recurrence in patients with cardioinhibitory carotid sinus syndrome who are >40 years with recurrent frequent unpredictable syncope.^{90,292,293}

Hand grip

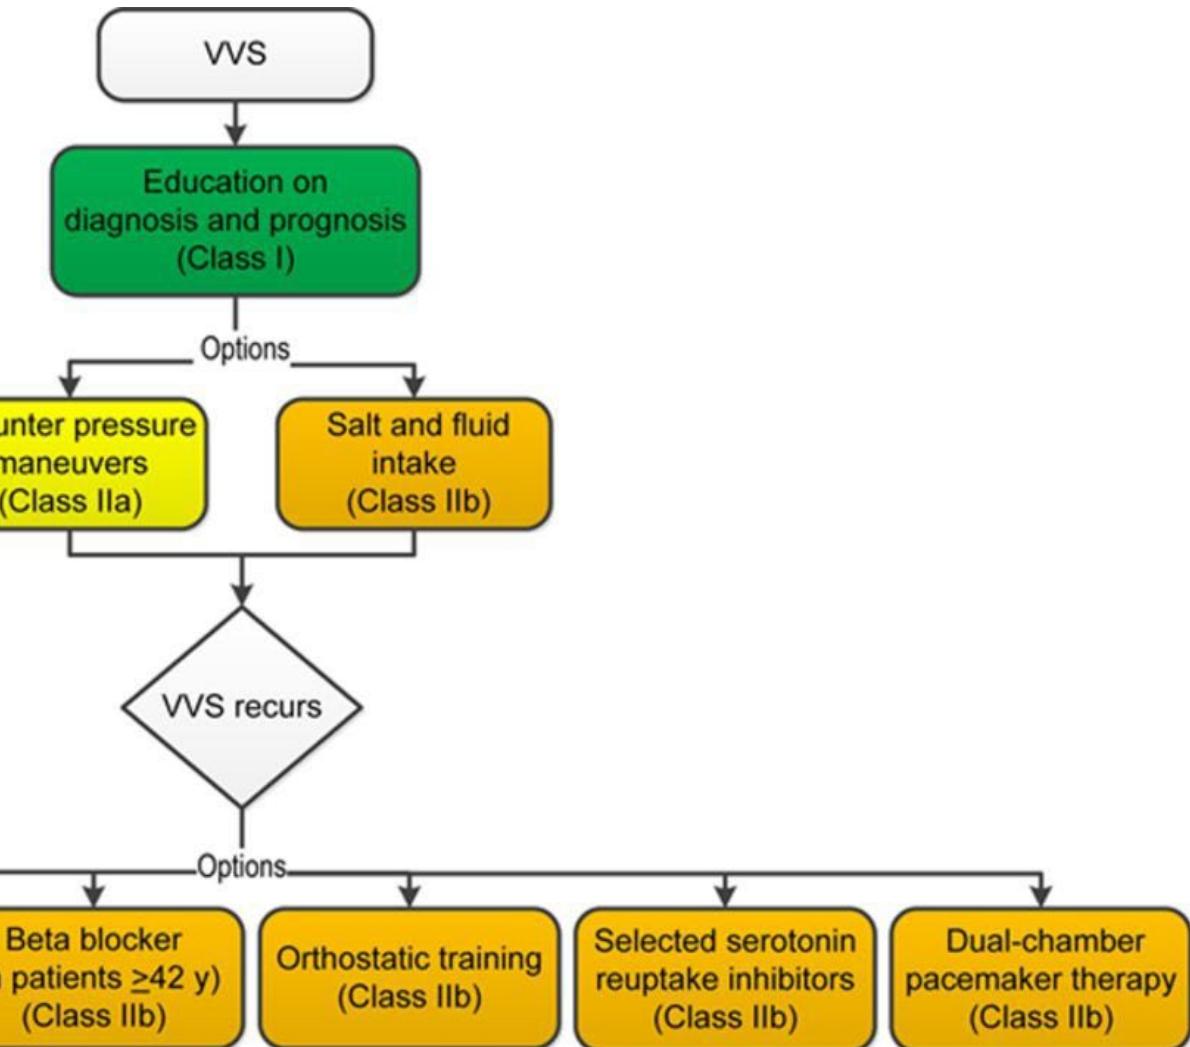

Grip a rubber ball or a similar object with the dominant hand for as long as possible or until the prodromes disappear.

Leg crossing

In an orthostatic position, cross the legs and contract the leg muscles, abdominal muscles, and gluteal muscles to the maximum.

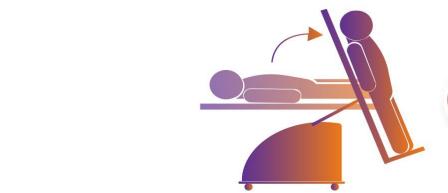

Arm tensing

Grip the hands one on the top of the other and try to push them apart with the maximum possible muscular contraction for as long as possible or until the prodromes disappear.

Severe, unpredictable and recurrent vasovagal syncope

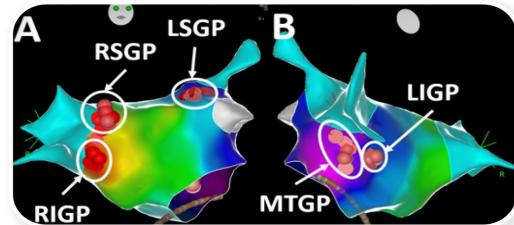

Education and lifestyle modifications

Spontaneous syncope in the presence of an asystolic pause >3 s

Age <40 years

CNA first*

Demonstration of cardioinhibitory mechanism

HUT

Physical counter-pressure maneuvers

ILR

Symptomatic asystolic pause(s) >3 s

Asymptomatic pause(s) >6 s due to sinus arrest or AVB

Age 40-60 years

Individualized approach

Age >60 years

DDD-CLS first

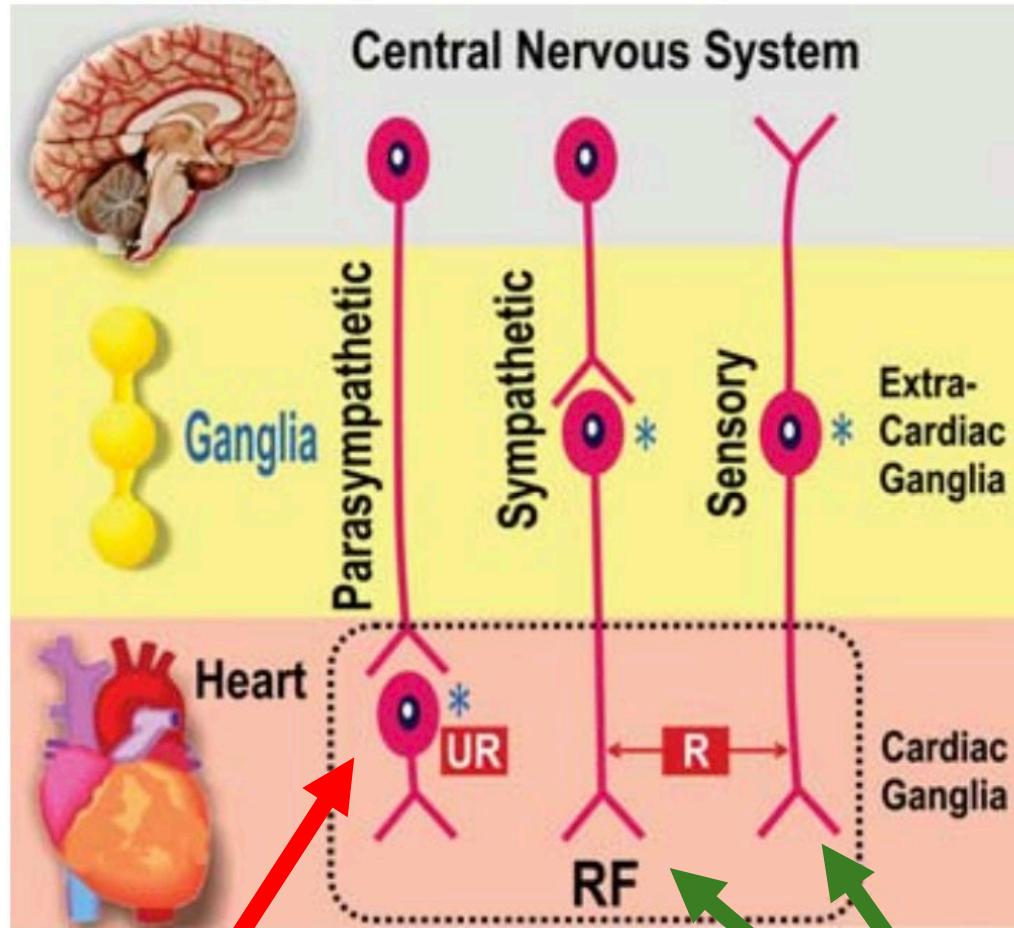

CNA if cardiac pacing has failed or a pacemaker if CNA has failed

Who to consider for cardioneuroablation

- Cardioinhibitory VVS
- Mixed VVS – if pause precedes hypotension
- Cardioinhibitory carotid sinus syndrome
- Functional AVB
- Vagal hypertonicity
- Vagally-mediated AF as adjuvant to CPVI

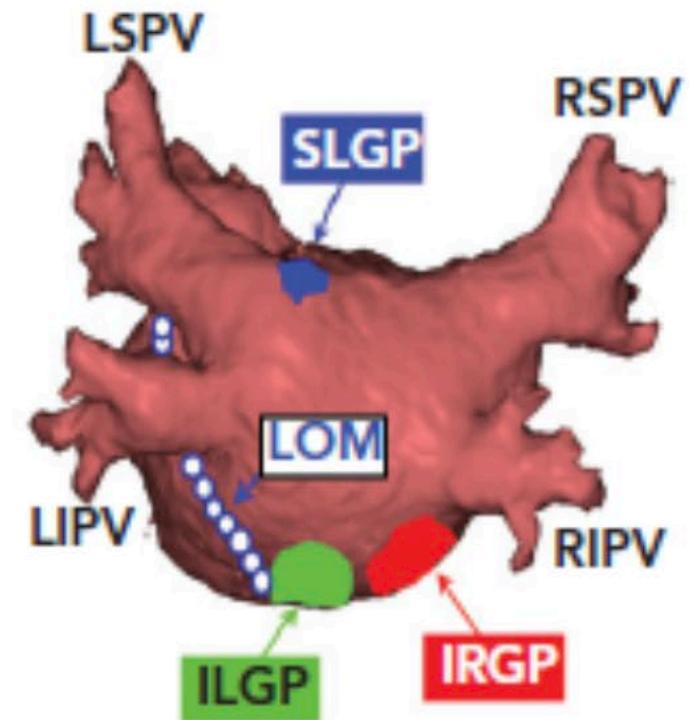

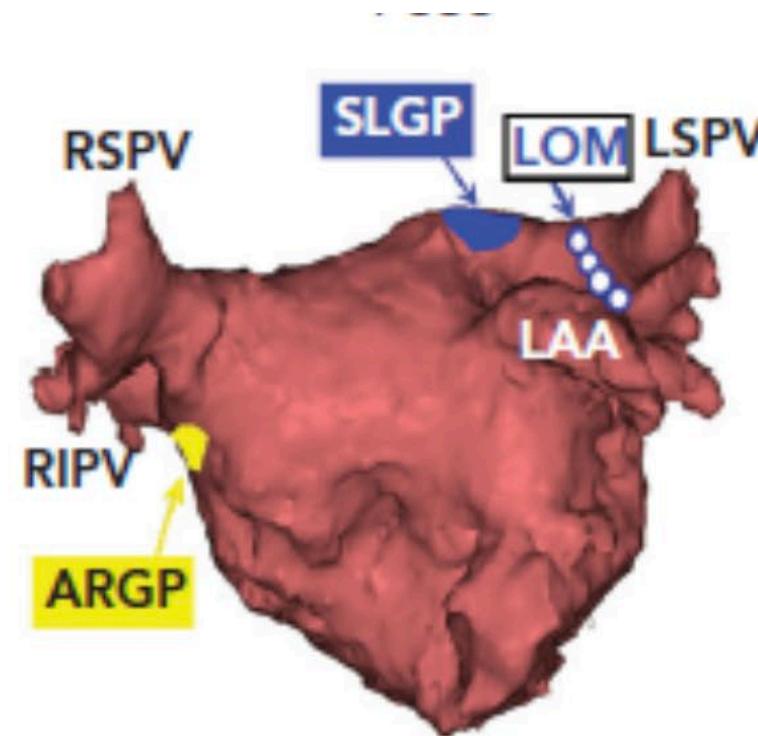

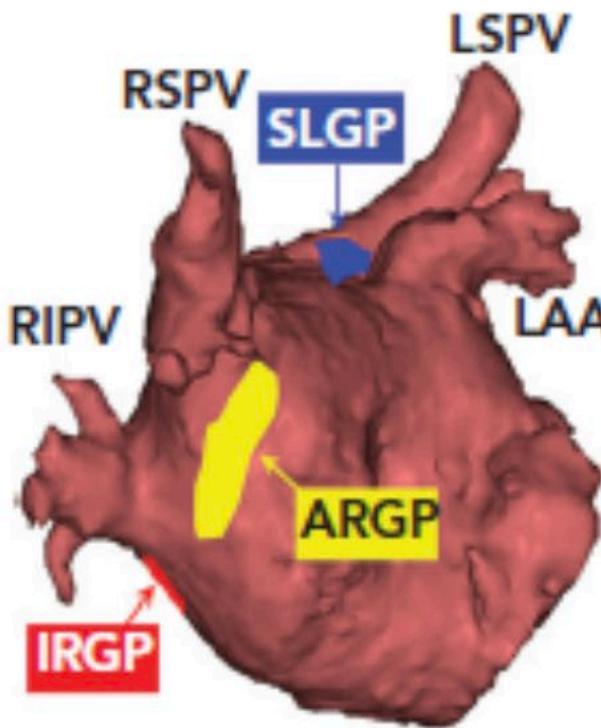

Anatomy and interrelation of GPs

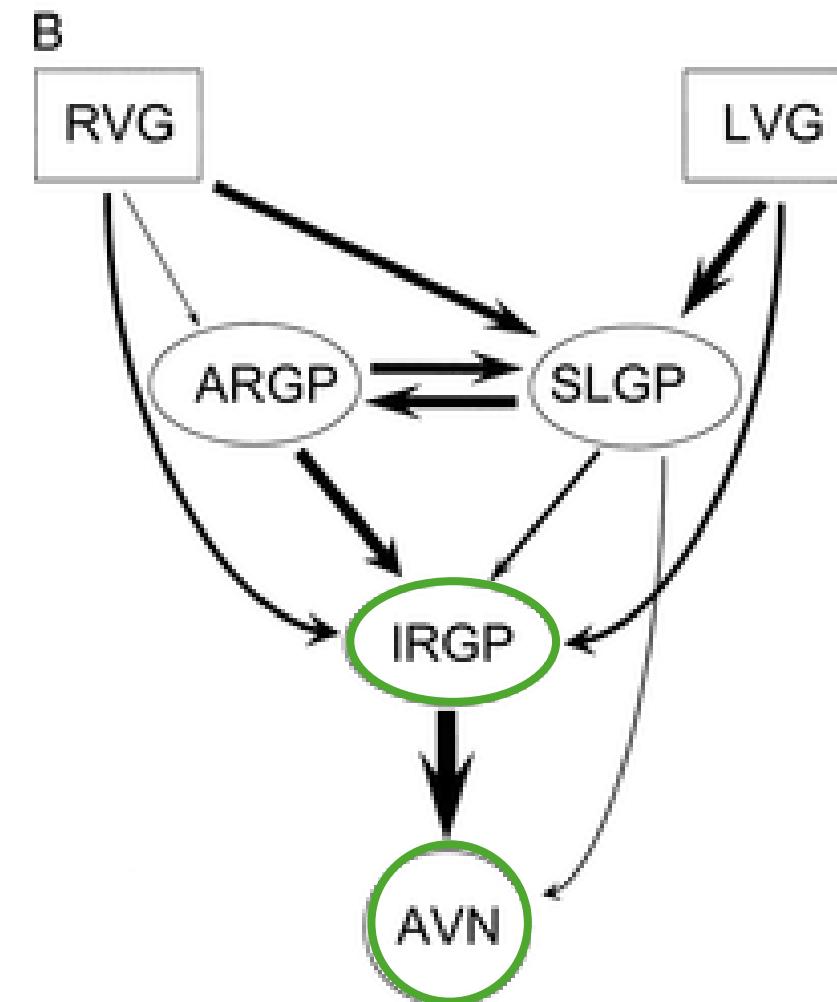

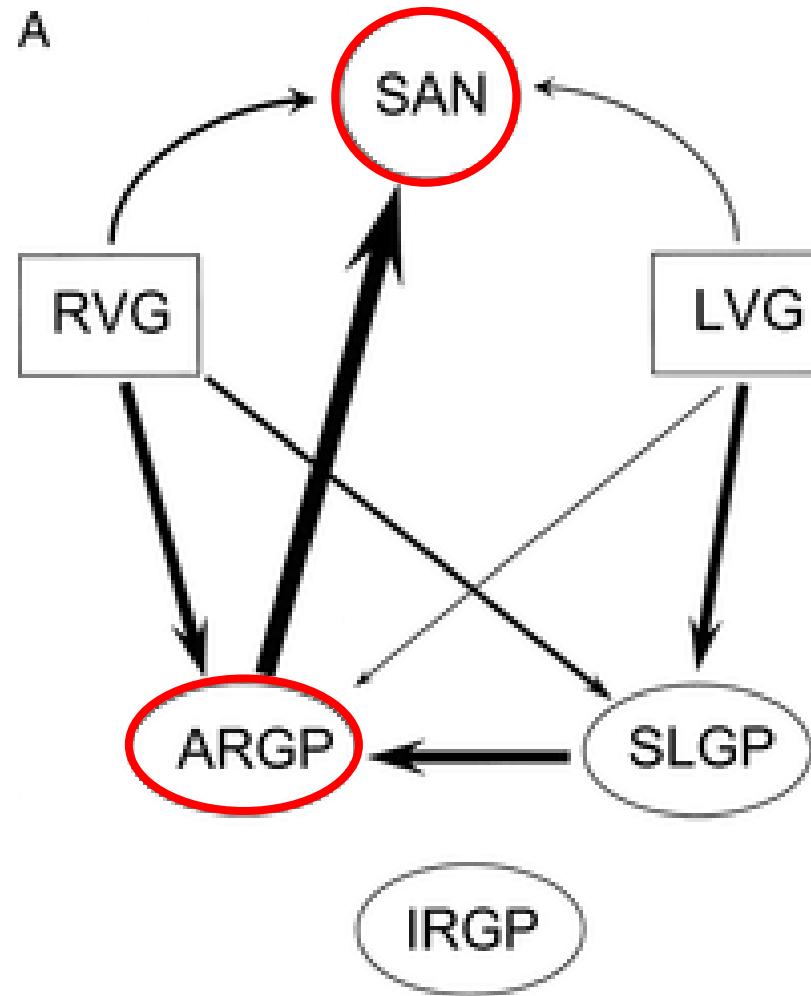

**Lack of
regeneration**

Regeneration

GP are localised in the epicardial fat, close to PV ostia and ligament of Marshall

Canine model – 28 dogs

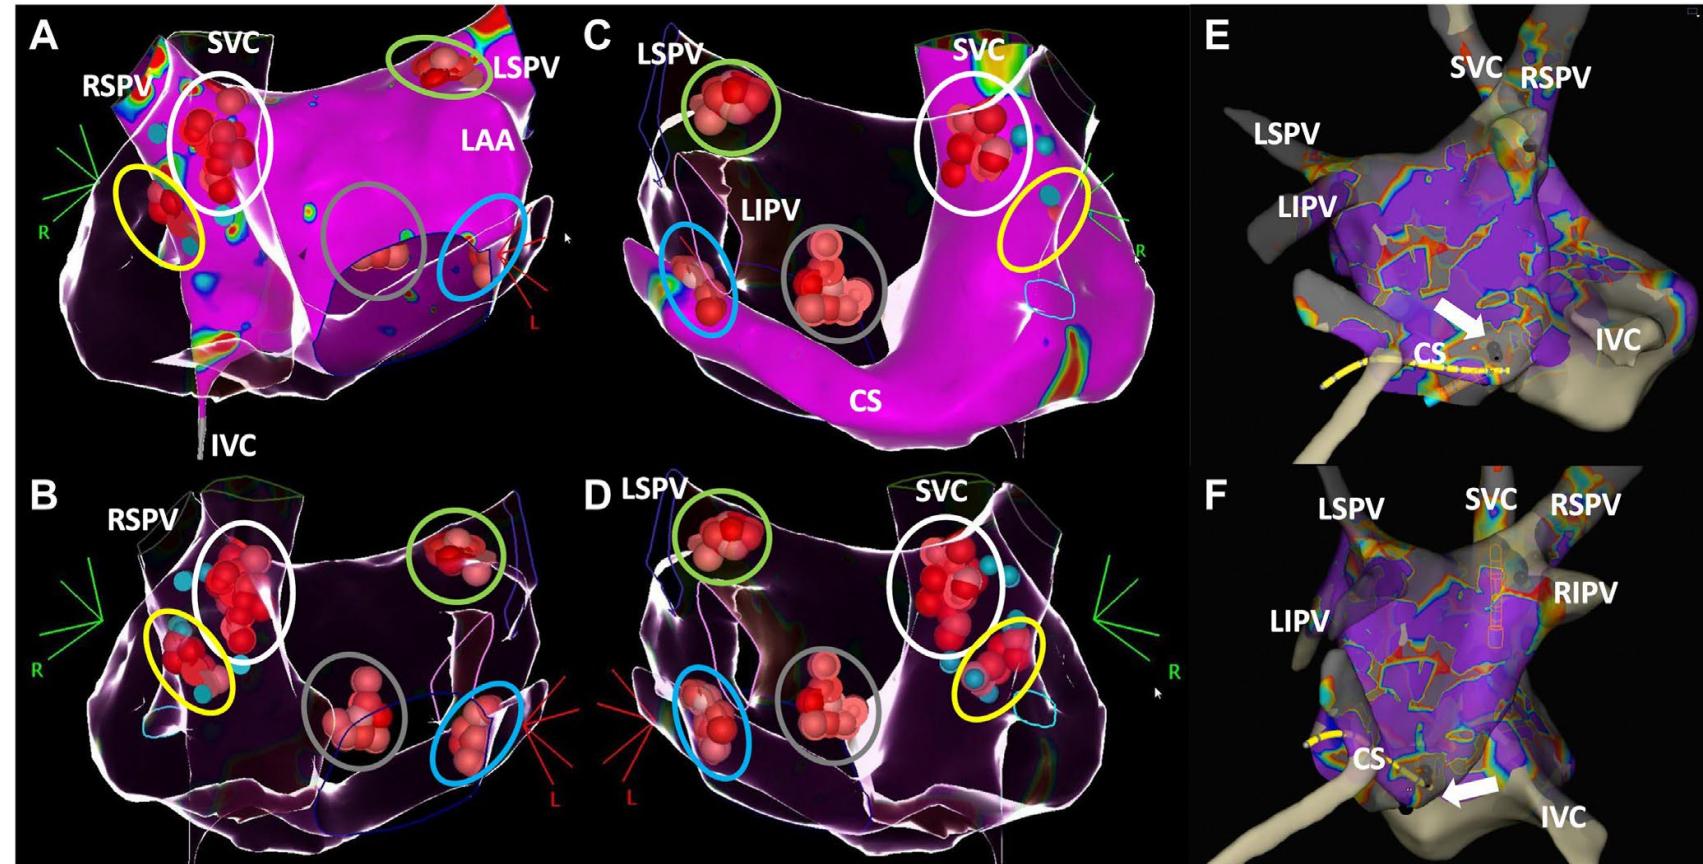

anterior right GP (ARGP)
inferior right ganglionated plexi (IRGP)
superior left ganglionated plexi (SLGP)

A: LA - AP view

B: LA - PA view

C: RA - PA view.

D: RA+LA PA view

White circle - **superior RAGP** - posterosuperior surface of the right atrium (RA) below the SVC/RA junction

Yellow circle - **posterior (inferior) RAGP** - adjacent to the interatrial groove

Green circle - **superior LAGP** - posterosuperior surface of the left atrium (LA) between the pulmonary vein

Gray circle - **left inferior (posterolateral) GP** - the posterolateral surface of the LA.

Blue circle - **the Marshall tract GP**

White arrow - **postero-medial LAGP** - postero-medial surface of the LA

GP terminology

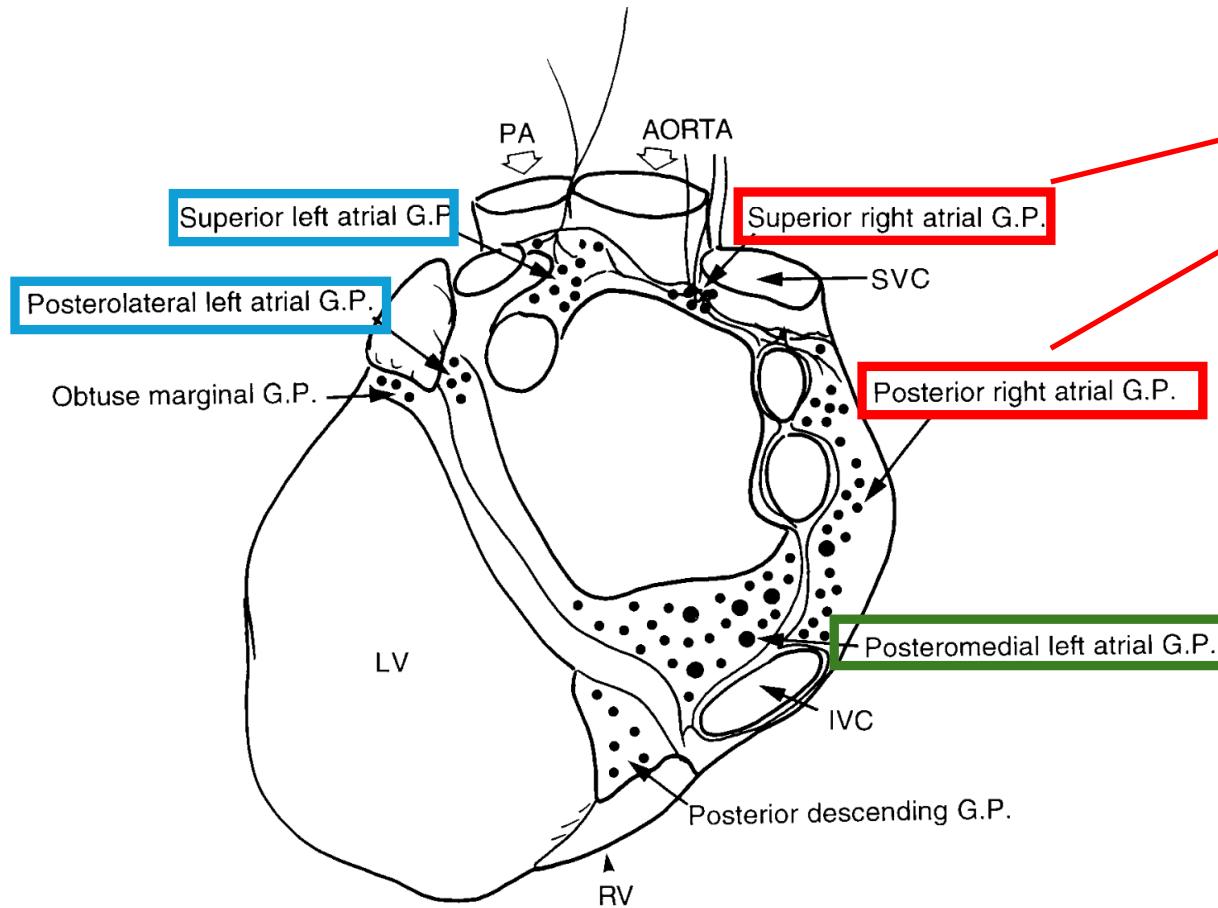

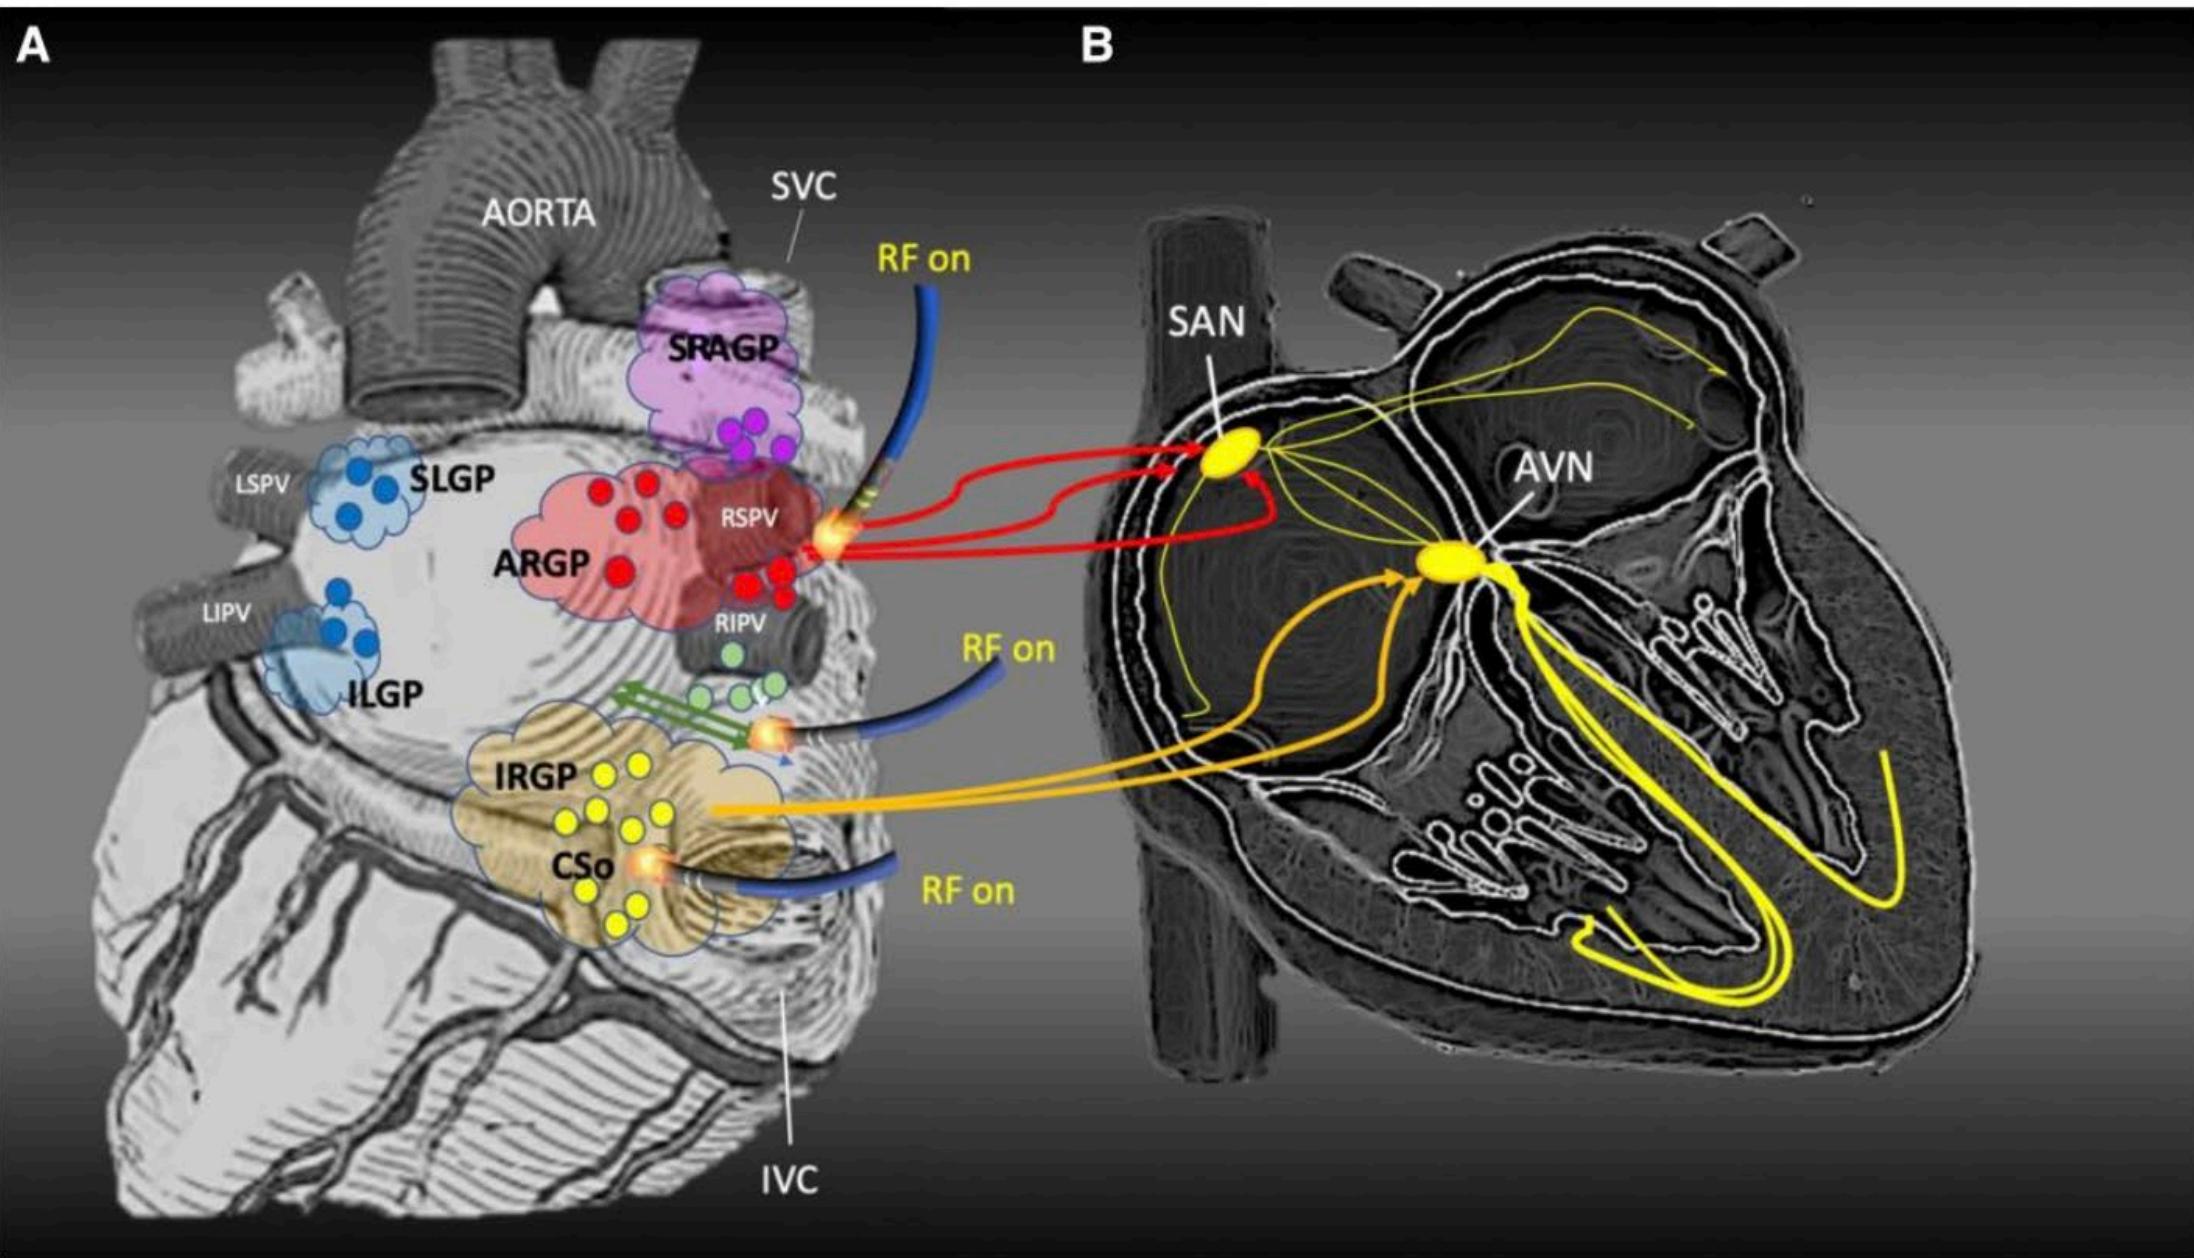

Fig. 1. Drawing of a posterior view of the human heart and major vessels illustrating the locations of posterior atrial and ventricular ganglionated plexuses. Note the mediastinal nerves coursing adjacent to the aortic root and joining the two superior atrial ganglionated plexuses. Positions of the superior vena cava (SVC), inferior vena cava (IVC), right ventricle (RV), and left ventricle (LV) are shown.

SAN innervation mostly originates from right superior GP and right posterior GP

AVN innervation mostly originates from right posterior GP and left postero-medial GP

Proposed new terminology – Prof. Kulakowski
Superior paraseptal GP = RAGP, RSGP
Inferior PS GP = PMLAGP, IRGP, LIGP

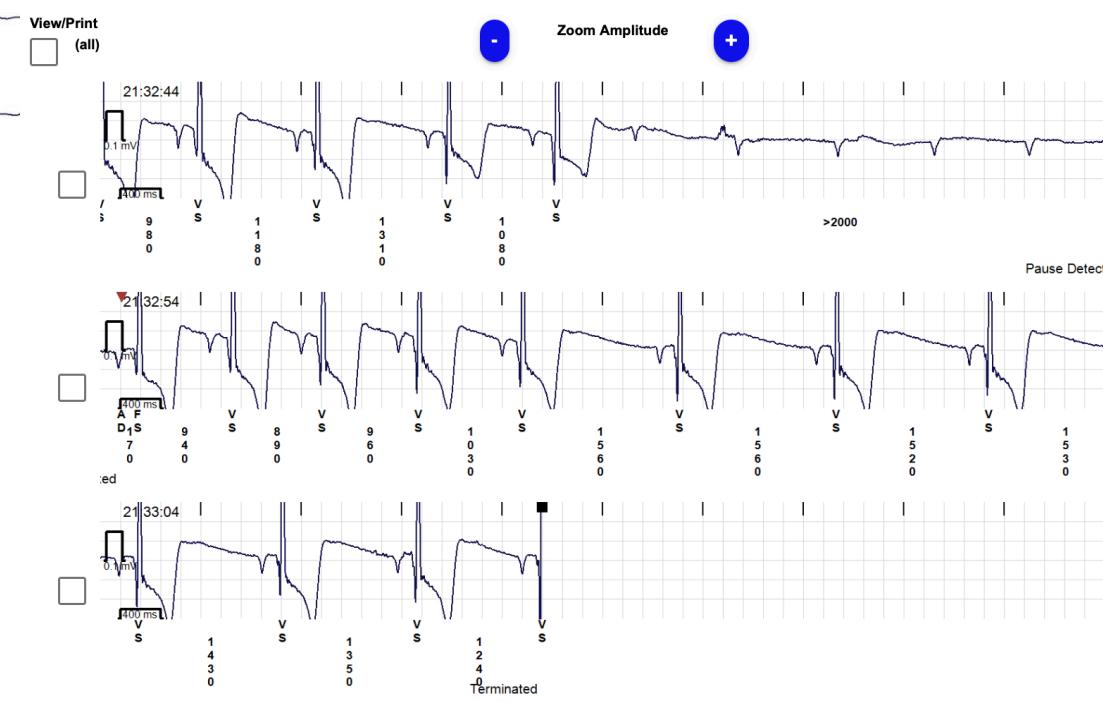

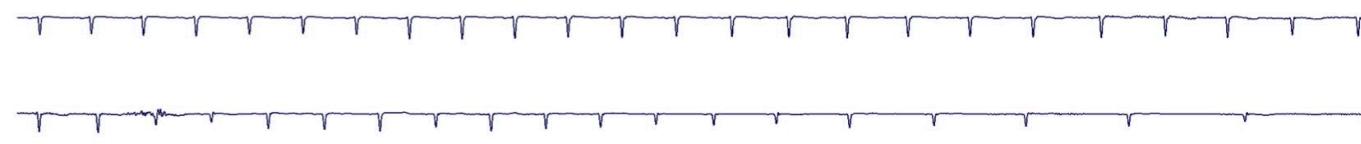

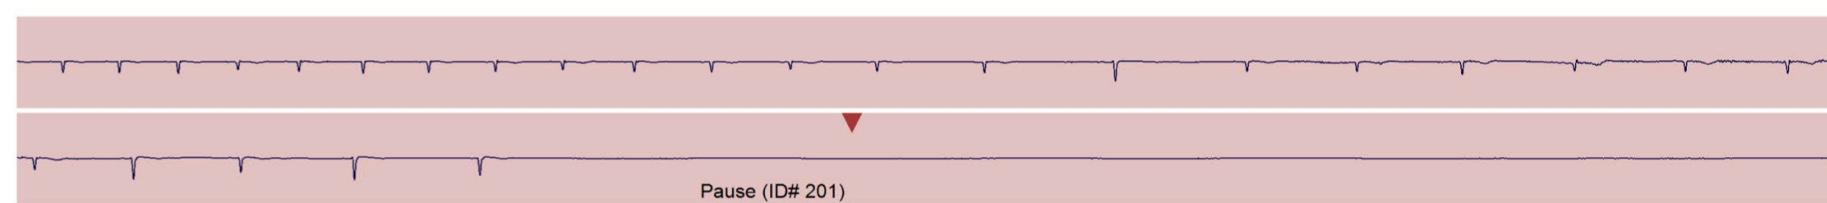

Patient preparation

Symptom (Patient Activated)

Automatic Detection Recording

Detected

10 seconds

Functional SNA and AVB

- Exclusion of intrinsic disease of the SAN/AVN
- Exercise test - chronotropic competence
- **Atropine testing –**
 - at least 24 hours before CNA.
 - IV Atropine sulfate bolus (0.04 mg/kg; maximum 3 mg) under continuous electrocardiography.
 - Positive test- heart rate increases by 25% or accelerates to 90 beats/min.
 - Reversal of AV block
- EPS – normal SNRT (if equivocal repeat under Atropine) / exclusion of infranodal disease

Conscious sedation vs general anesthesia

- General anesthesia –
 - basal HR
 - May blunt vagal response
 - Muscle relaxants - Phrenic pacing
- Conscious sedation
 - May blunt basal HR – Delta HR may decrease with RF
 - Deep sedation may blunt vagal response

EAM mapping

- Bipolar map of both atria
- Annotation of sinus node, His bundle and phrenic nerve capture sites.
- GP localization

Techniques for GP identification:

1- High-frequency stimulation (HFS) to presumed GP sites

20 Hz, 10–30 V; pulse width 1-10 ms, 2-5 seconds duration

Positive vagal response (asystole, AV block or PP -or- RR increase > 50%)

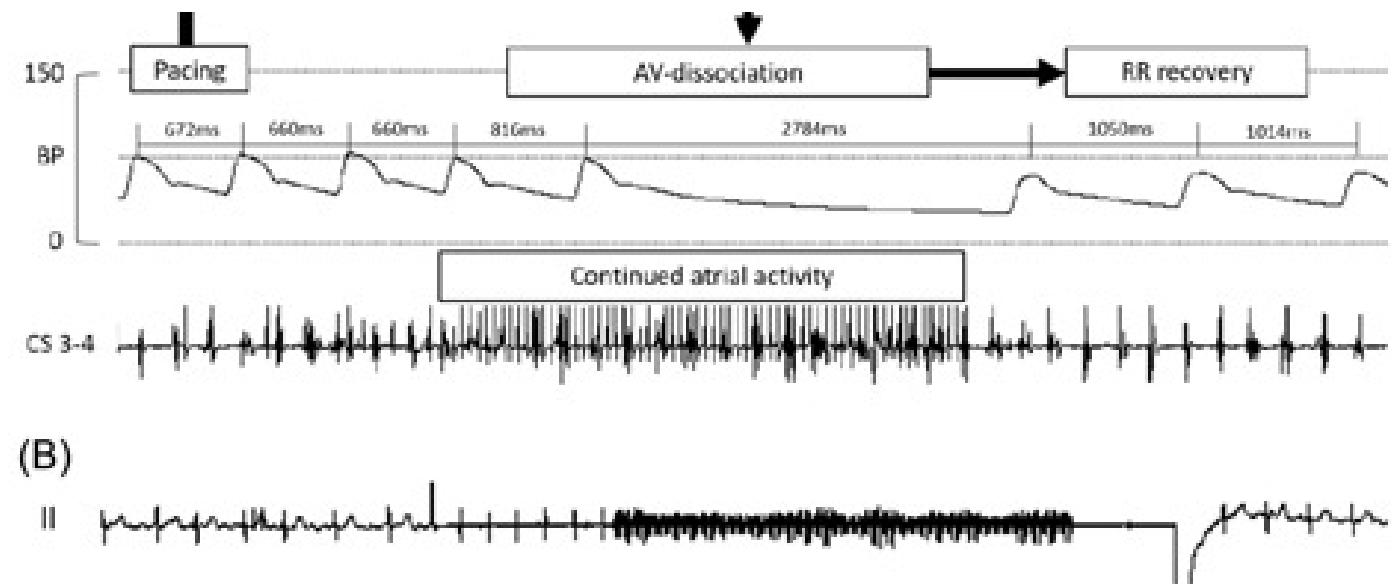

Vagal response areas tagging and RF delivery

Time consuming

not always reproducible

Painful if on sedation

AF induction

Techniques for GP identification:

2- Electrogram analysis –

2004 Pachon et al -

fast Fourier transformation of the endocardial potentials.

Normal atrial myocardium – homogenous uniform aEGM.

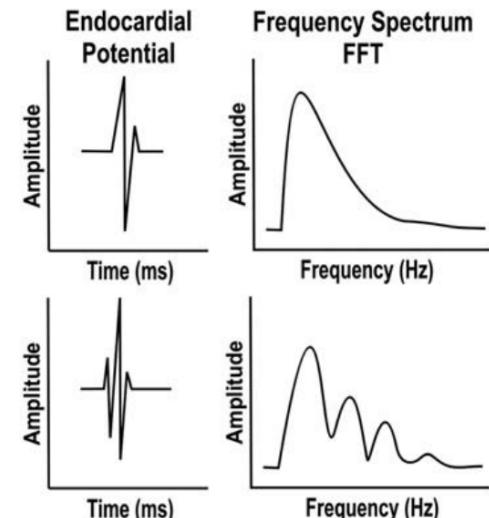

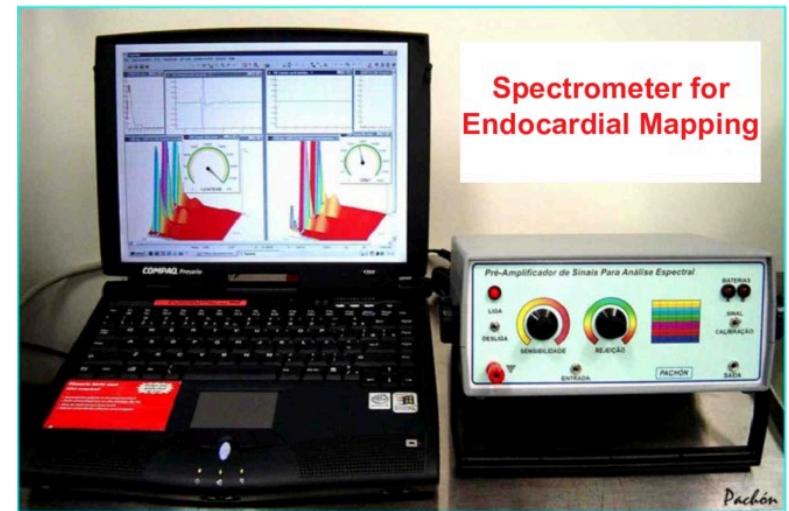

GP sites - several fractions having frequencies higher than 100 Hz.

Possible higher high-pass filters (>100 Hz) leads to a better identification of fractioned potentials.

local fractionated signals

may be due to fibrosis, double potentials etc.

Sensitivity and specificity???

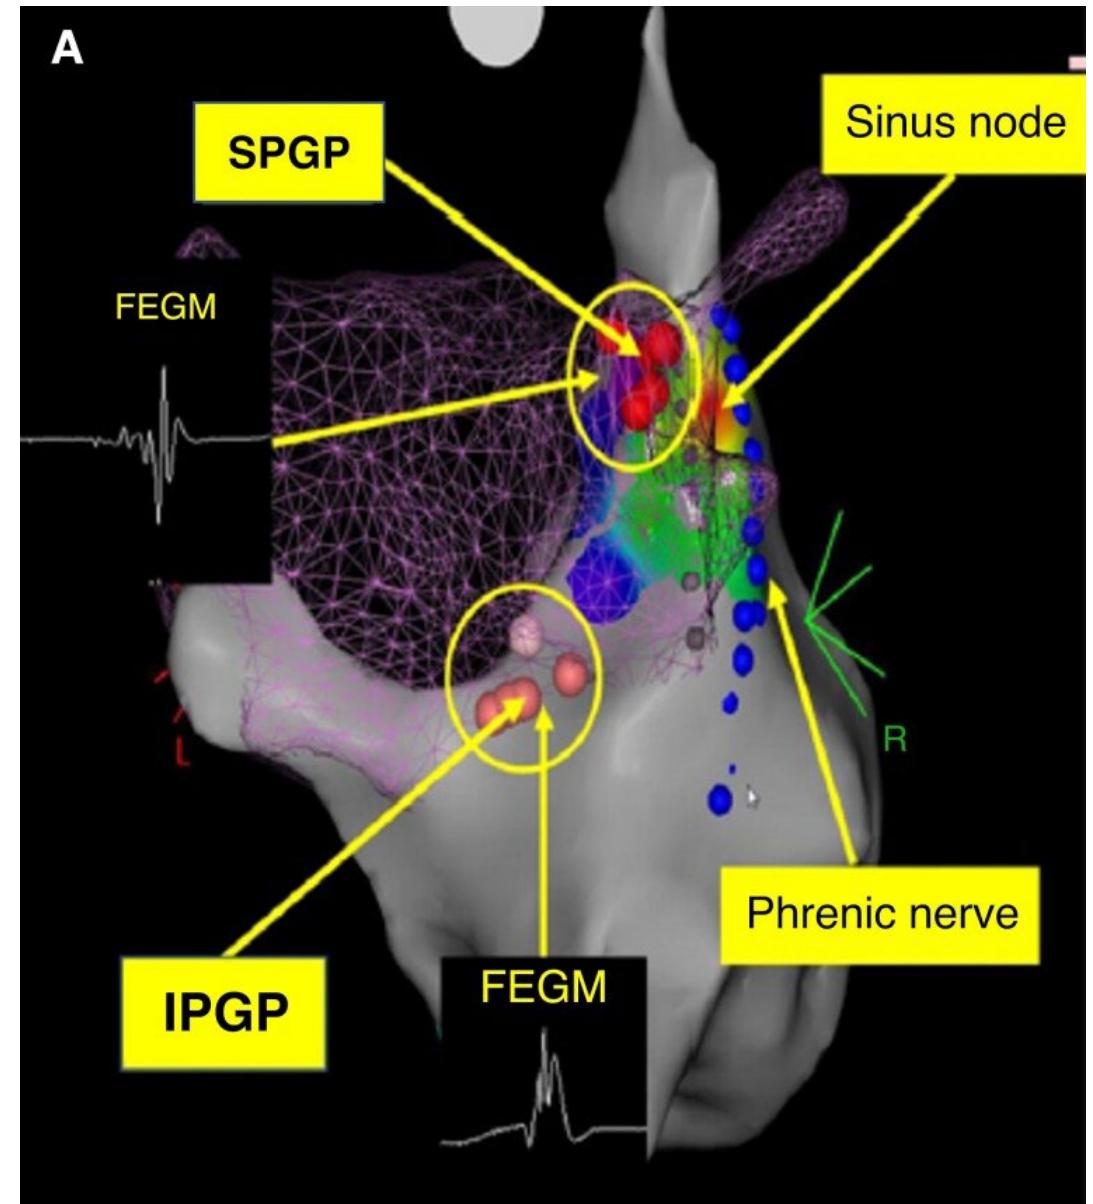

Techniques for GP identification:

2- Electrogram analysis –

Aksu workflow -

filter settings of 100/200–500 Hz.

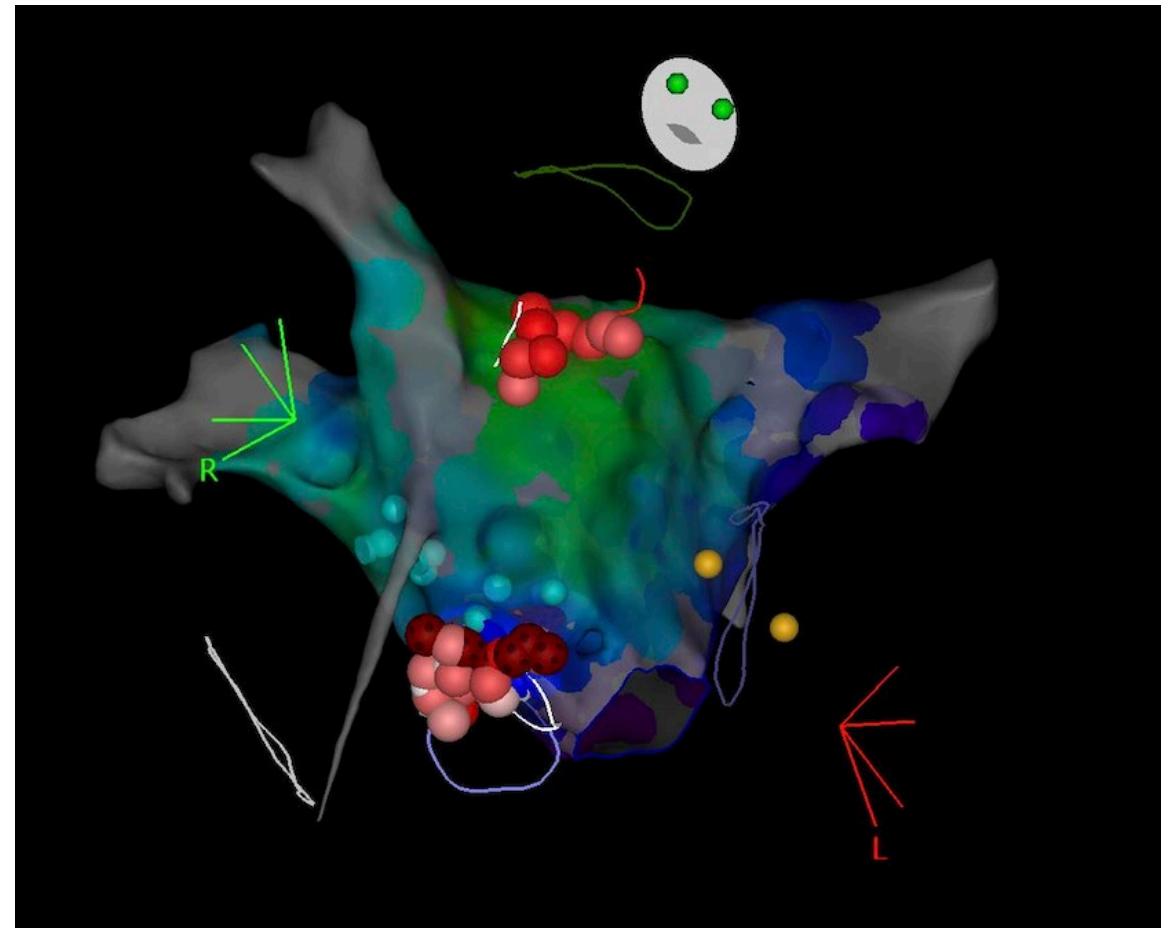

aEGM with >3 deflections are tagged as possible GP sites.

Techniques for GP identification:

3- Empirical anatomical -

Pure electroanatomical (EAM) by CT merging

Feasibility of CT-Guided CNA

12 VVS pts. 6 male, 53 ± 13 years

Positive Tilt test

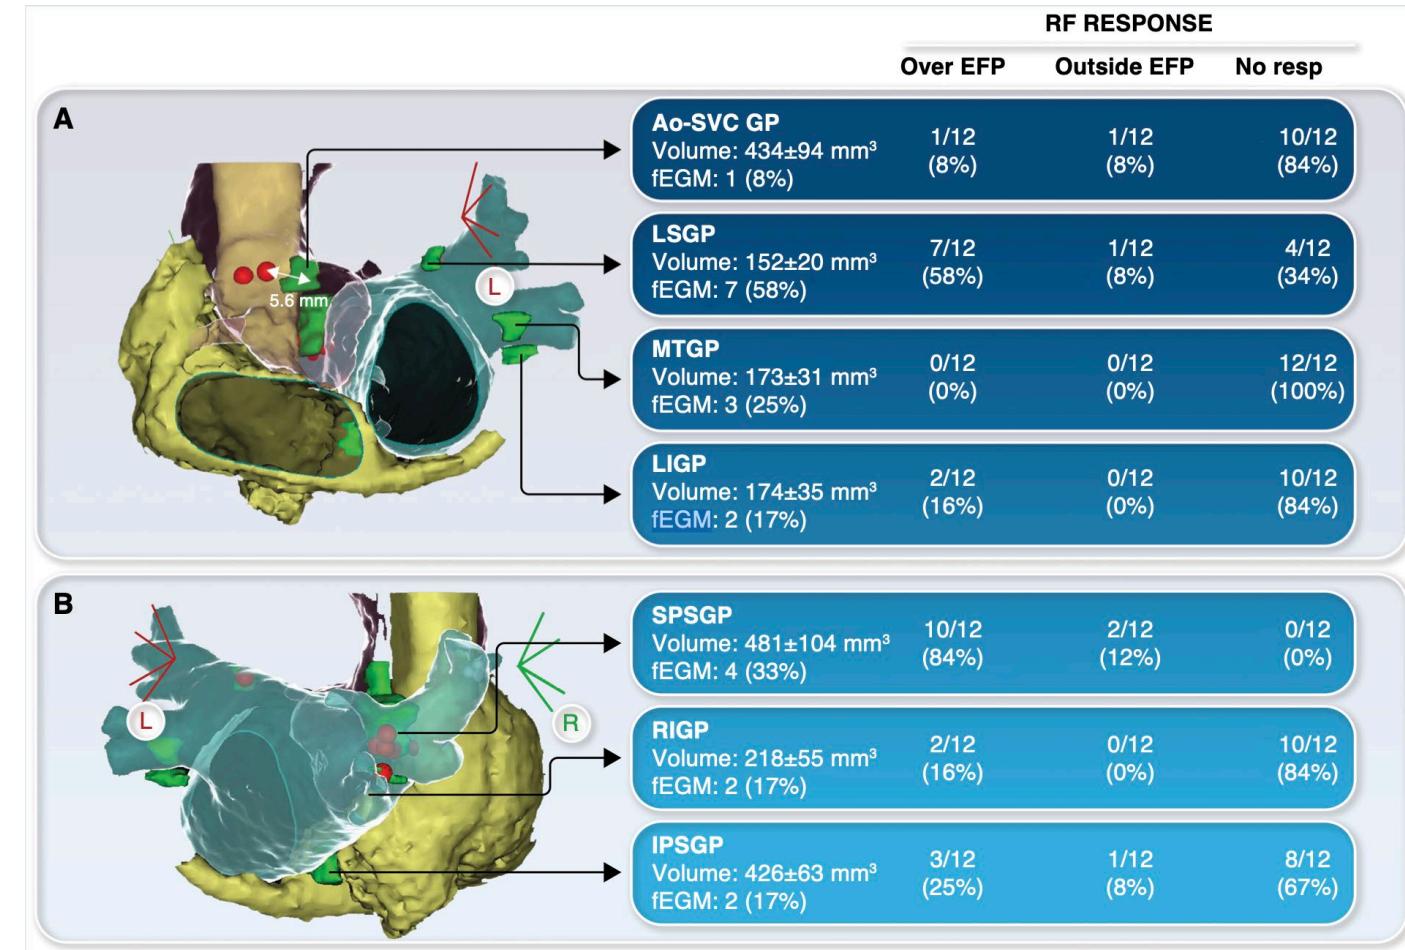

Positive Atropine test

CT - ADAS3D (developed for myocardial fibrosis analysis)

Procedure end-points:

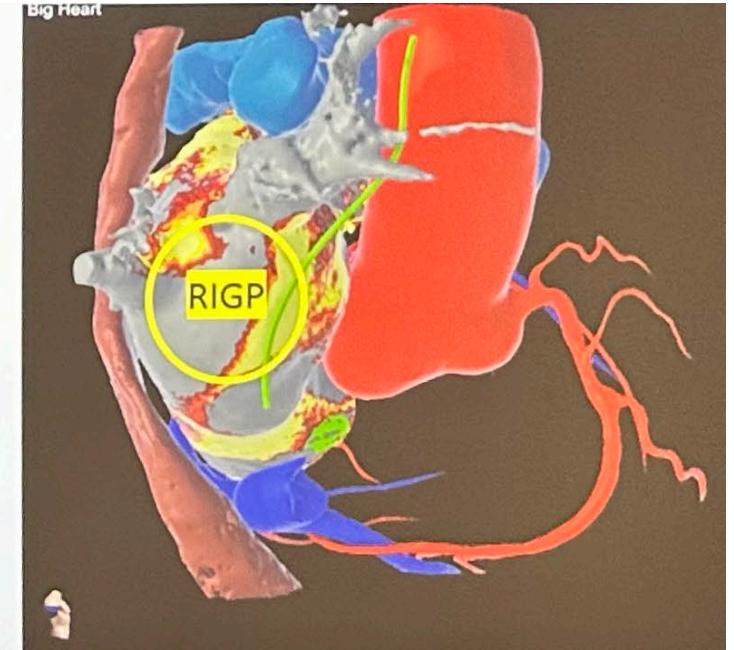

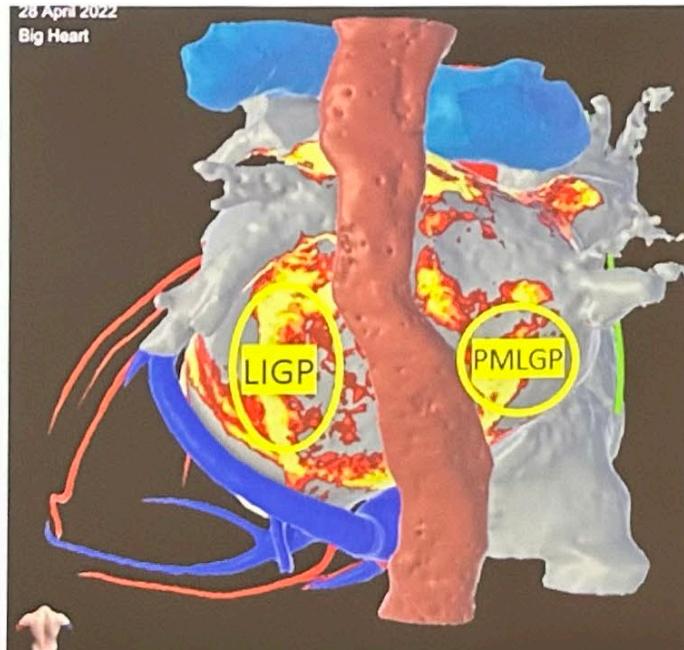

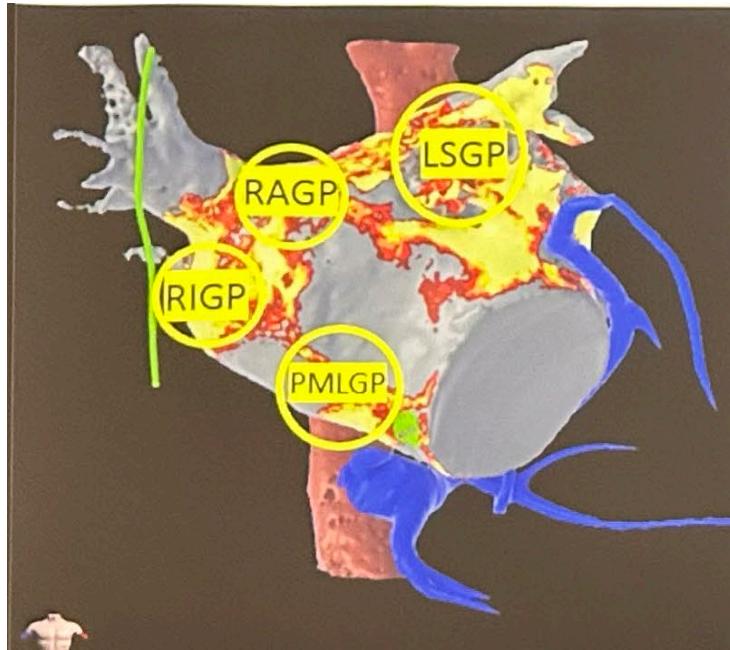

- Abolition of RF-induced vagal response for left PV GPs
- Increase in basal HR $\geq 25\%$ for SPSGP, RIGP and Ao-SVC GPs
- Shortening of AH interval for IPSGP.

This study shows that CT-based EFP-guided CNA for CI-VVS is feasible, can assist RF delivery with high precision and has the potential to overcome the interpatient variability that affects CNA when performed solely by anatomic landmarks.

InHeart module

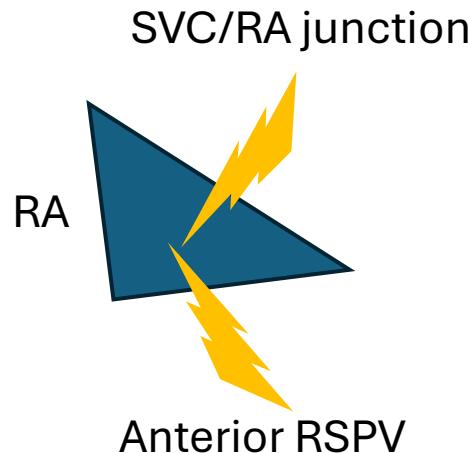

- AI-Powered Segmentation
- cloud-based software solution
- CT or MRI image transformation to interactive 3D models + segmentation.

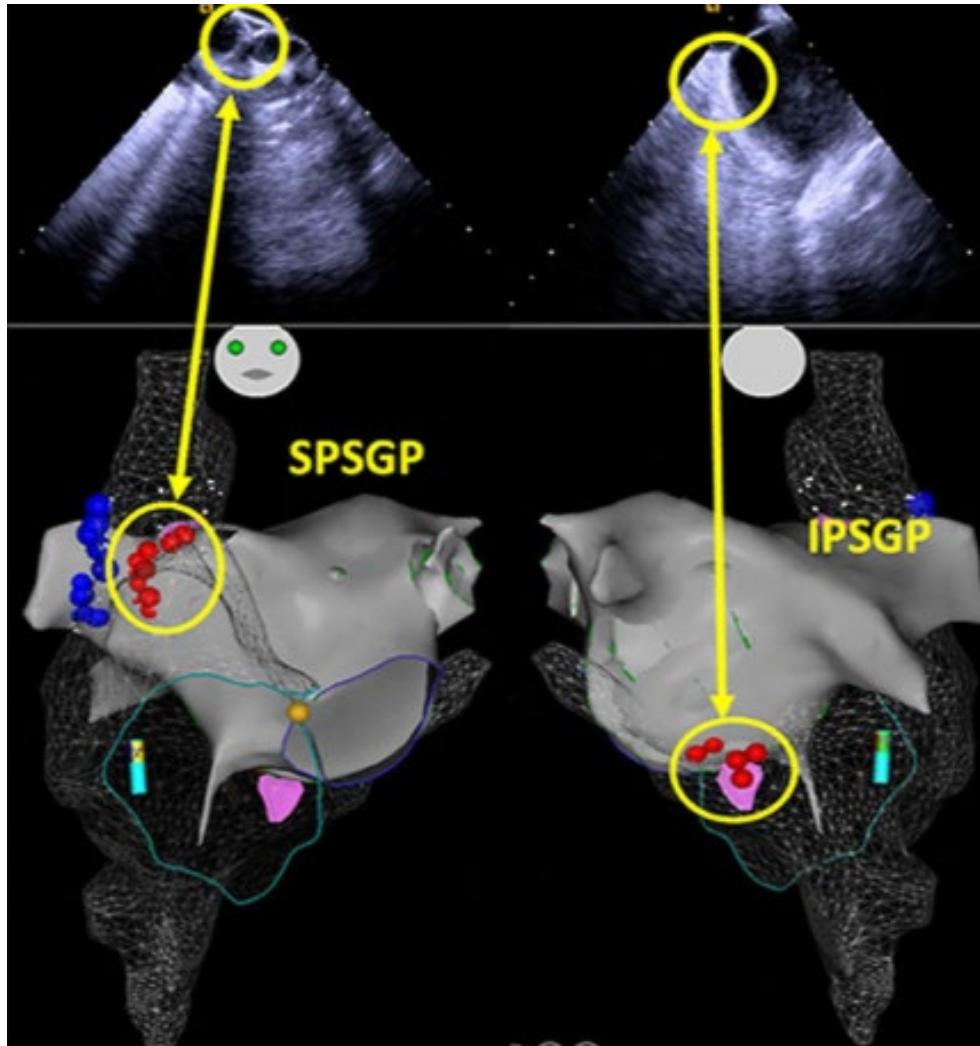

3- Empirical anatomical - ICE

Shows online real-time anatomy
creation of 3D EAM by CartoSound module
Efficacy of RF application by tissue whitening.

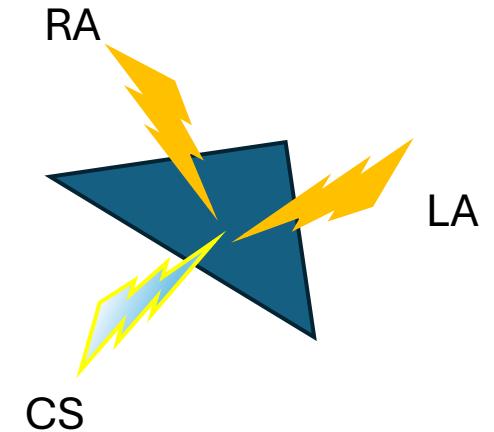

Superior paraseptal GP =
RAGP, RSGP

Superior paraseptal GP
= RAGP, RSGP

Inferior paraseptal GP =
PMLAGP, IRGP, LIGP

Inferior PS GP = PMLAGP, IRGP, LIGP

Which GP should be targeted???

Table 1: The Major Clinical Studies of Cardioneuroablation

Study	Cases of VVS	Types of VVS	Identification of GP	Location of GP	RAGP Ablation	Endpoint of Ablation	Follow-up	Syncope Recurrence	Complications

Cardioneuroablation for vasovagal syncope: A systematic review and meta-analysis

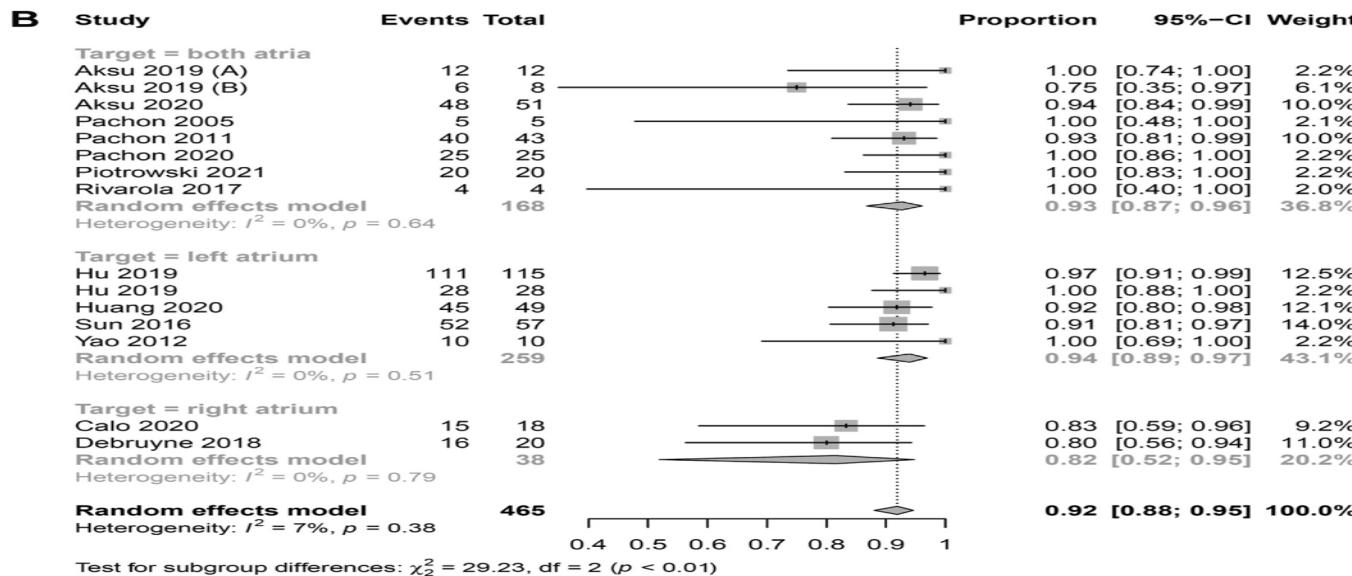

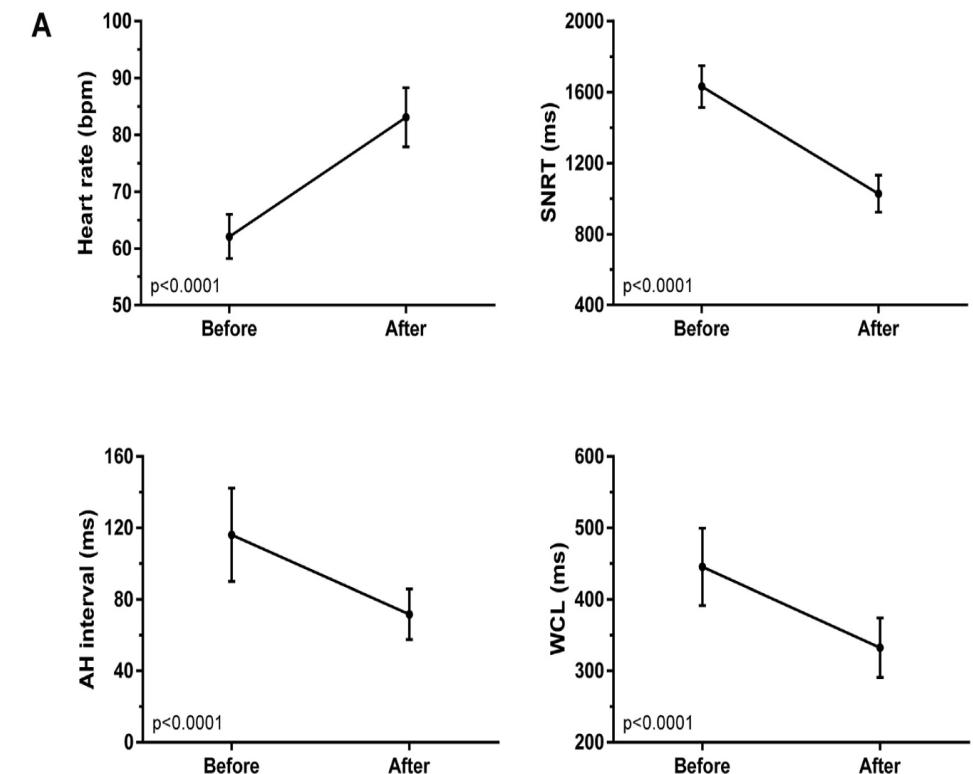

Table 2. Comparison Between the HFS- and Anatomically Guided Ablation Groups

	HFS-Guided Ablation (n=10)	Anatomically Guided Ablation (n=47)	P Value
Procedure time, min	50.2±3.8	43.7±6.1	0.002
Fluoroscopy time, min	11.2±1.7	6.1±2.9	<0.001
RF applications, n	9.1±1.4	34.6±5.4	<0.001
LSGP	6.3±0.9	11.0±3.2	<0.001
LLGP	—	6.2±1.7	—
LIGP	1.5±2.0	5.9±1.6	<0.001
RAGP	1.3±1.4	6.1±1.6	<0.001
RIGP	0	5.4±0.9	<0.001
RF delivery time, s	345.0±121.9	622.8±210.3	<0.001
LSGP	242.0±73.3	275.1±117.7	0.398
LLGP	—	97.2±68.5	—
LIGP	54.0±75.9	88.1±61.7	0.134
RAGP	49.0±56.1	93.4±59.1	0.034
RIGP	0	68.9±40.6	<0.001
Positive vagal response observed at each GP			
LSGP	10/10	42/47	0.574
LLGP	—	19/47	—
LIGP	3/10	15/47	1.000
RAGP	5/10	22/47	1.000
RIGP	0/10	11/47	0.183

GP indicates ganglionated plexus; HFS, high-frequency stimulation; LIGP, left inferior ganglionated plexus; LLGP, left lateral ganglionated plexus; LSGP, left superior ganglionated plexus; RAGP, right anterior ganglionated plexus; RF, radiofrequency; RIGP, right inferior ganglionated plexus.

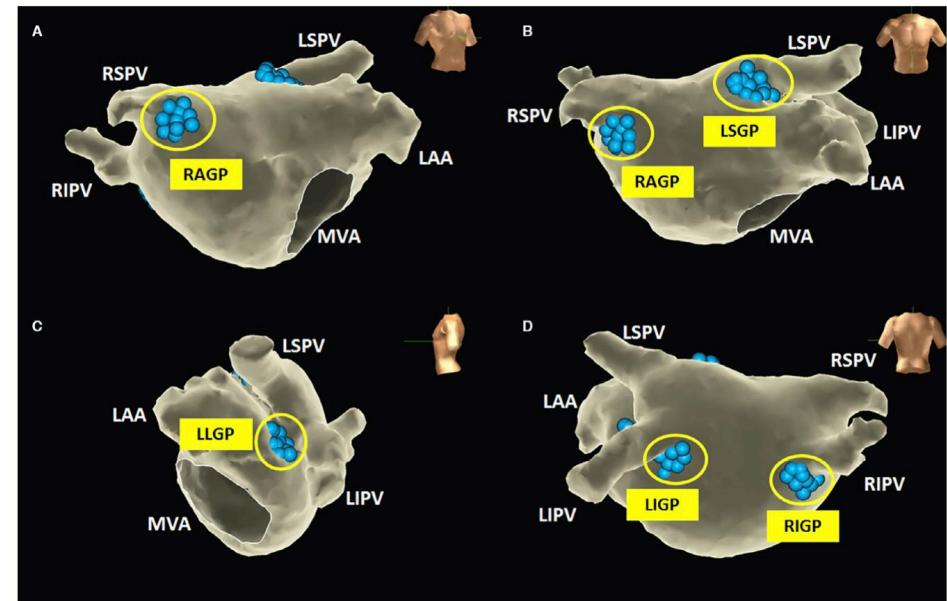

Subgroup analysis for ablation target.

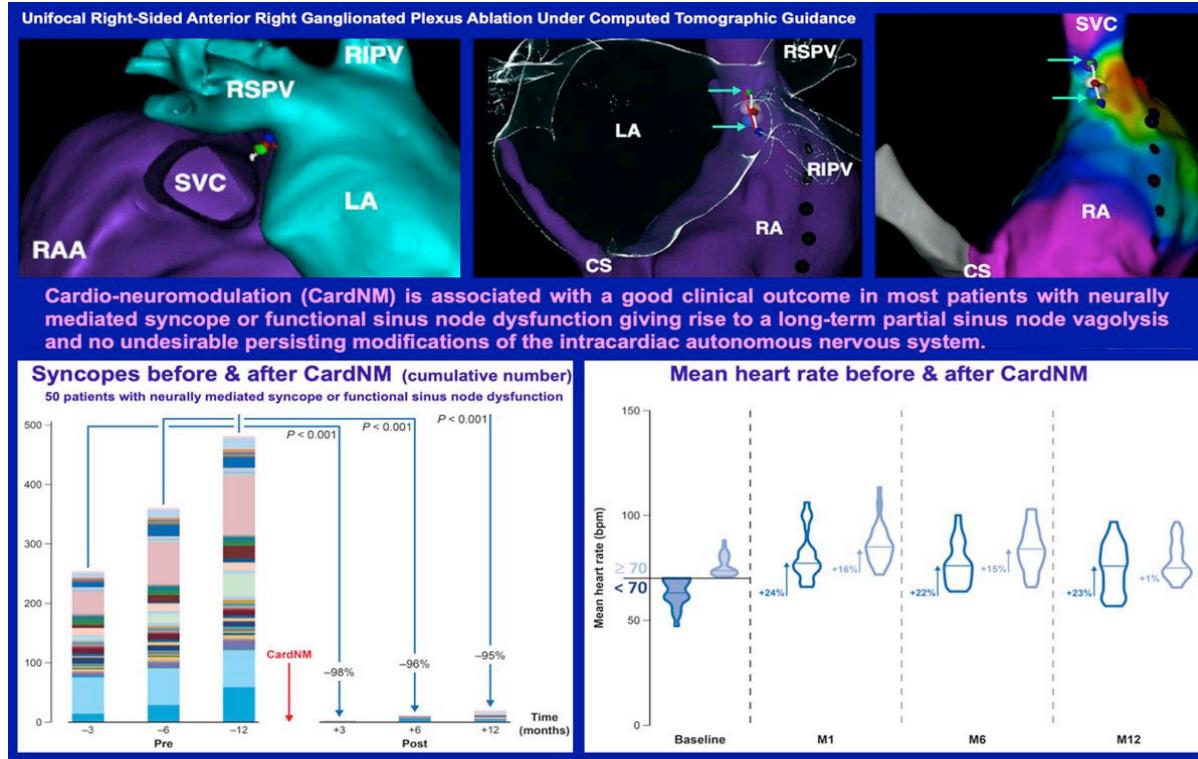

Overall freedom from syncope rate of 92% for CNA

Catheter Ablation as a Treatment for Vasovagal Syncope: Long-Term Outcome of Endocardial Autonomic Modification of the Left Atrium

- 57 consecutive patients (aged 43.2 ± 13.4 years; 35 women)
- Refractory vasovagal syncope
- Follow-up of 36.4 ± 22.2 months (range 12–102 months)
- 52 patients (91.2%) remained free from syncope.
- Prodromes recurred in 16 patients.
- No statistical differences were found between the high-frequency stimulation and anatomically guided ablation groups in either freedom from syncope (100% versus 89.4%, $P=0.348$) or recurrent prodromes (50% versus 76.6%, $P=0.167$).

Durable Physiological Changes and Decreased Syncope Burden **12 Months** After Unifocal Right-Sided Ablation Under Computed Tomographic Guidance in Patients With Neurally Mediated Syncope or Functional Sinus Node Dysfunction

- Target RAGP via right approach only
 - CT guided anatomical approach
 - General anesthesia
 - Ablation index 800
 - Endpoint – Increase in HR
 - Follow-up – Holter monitoring and clinical outcomes
-
- Lower rate of **syncope** (**-95%**) and **presyncope** (**-95%**) at 12 months versus baseline ($P<0.001$).
 - 37 pts. remained entirely free of syncope at 12 months
 - The **syncope-free survival curve** remained stable between the 12- and 30-month follow-up.

RECRUITING ⓘ

Efficacy of a Right-sided Ablation of the Anterior Ganglionated Plexus for Neurally Mediated Syncope (CardNMH3)

ClinicalTrials.gov ID ⓘ NCT04755101

Sponsor ⓘ Imelda Hospital, Bonheiden

Information provided by ⓘ Philippe Debruyne, Imelda Hospital, Bonheiden (Responsible Party)

Last Update Posted ⓘ 2023-04-04

The primary goal of the study is to determine whether a CT-guided, right-sided ablation of the anterior ganglionated plexus safely reduces the risk of recurrent episodes of syncope in patients with a history of recurrent NMS.

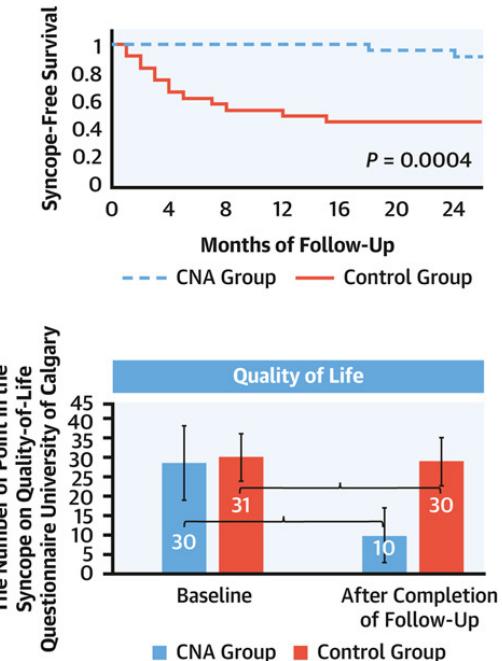

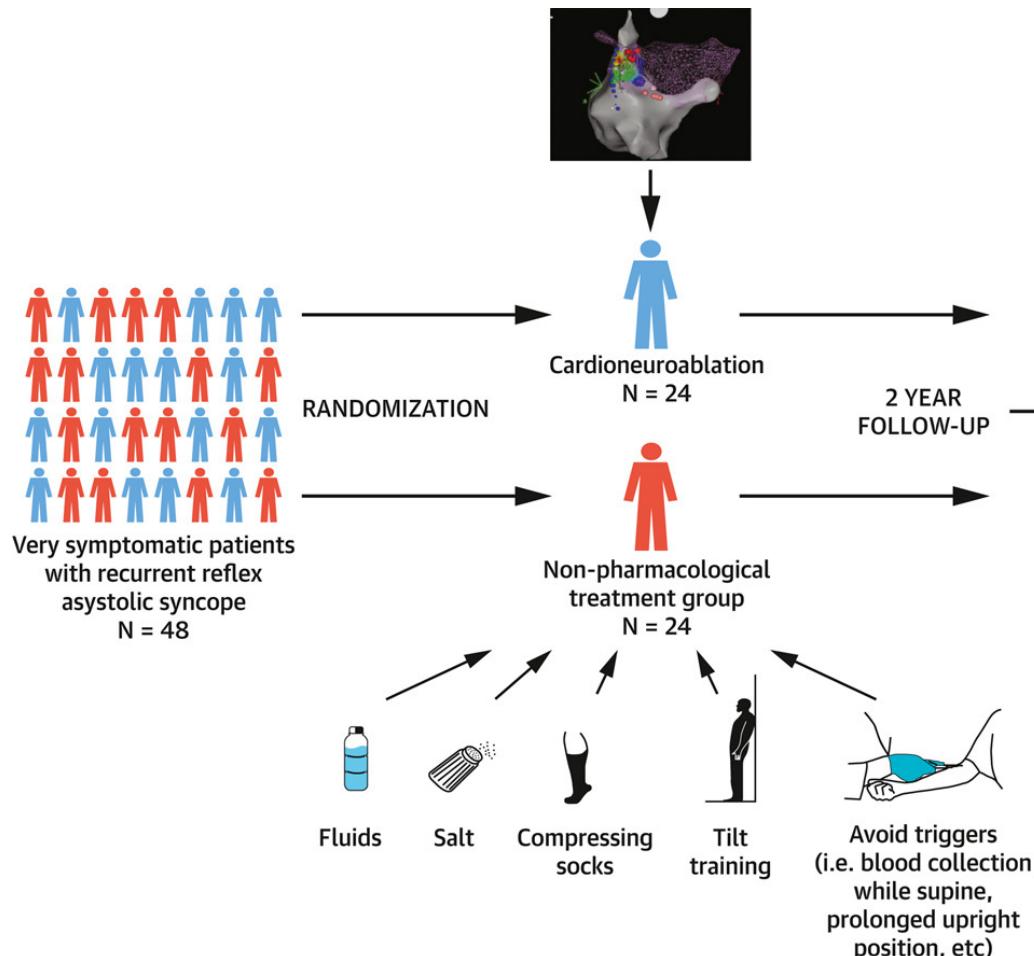

Two-third of the patients will be randomized to the active arm and **one-third to the control arm (sham).**

Cardioneuroablation for Reflex Syncope: Efficacy and Effects on Autonomic Cardiac Regulation – ROMAN 1 trial

- The first prospective randomized trial
- CNA versus optimal nonpharmacologic therapy in patients with cardioinhibitory VVS.
- Documented symptomatic cardioinhibitory or mixed VVS and positive atropine test.
- LA+ RA GP ablation
- ICE guided
- GPs – Paraseptal GP from left atrial approach → Left sided RAGP (anterior right PV line) → right paraseptal GP → right sided RAGP
- Ablation index 400
- Follow-up lasted 2 years.
- Primary endpoint was **time to first syncope recurrence**.
- Secondary endpoints included changes in sinus rhythm and heart rate variability measured in **holter** ECG (3, 12, 24 months) + **QOL** and baseline and completion of F/U.

Cardioneuroablation for Reflex Syncope: Efficacy and Effects on Autonomic Cardiac Regulation – ROMAN 1 trial

- 48 patients (24 in CNA group ,24 in control group)
 - 17 male
 - mean age 38 ± 10 years
- The primary endpoint occurred in:
 - 2 patients (8%) from the CNA group
 - 13 control patients (54%) ($P = 0.0004$).
- QOL
 - Significantly improved in the CNA group (30 ± 10 vs 10 ± 7 points; $P = 0.0001$)
 - Remained stable in control patients (31 ± 10 vs 30 ± 10 points; $P = 0.5501$).

Cardioneuroablation: coMparison of acute effects of right versus left atrial Approach in patients with reflex syncope – ROMAN 2 study

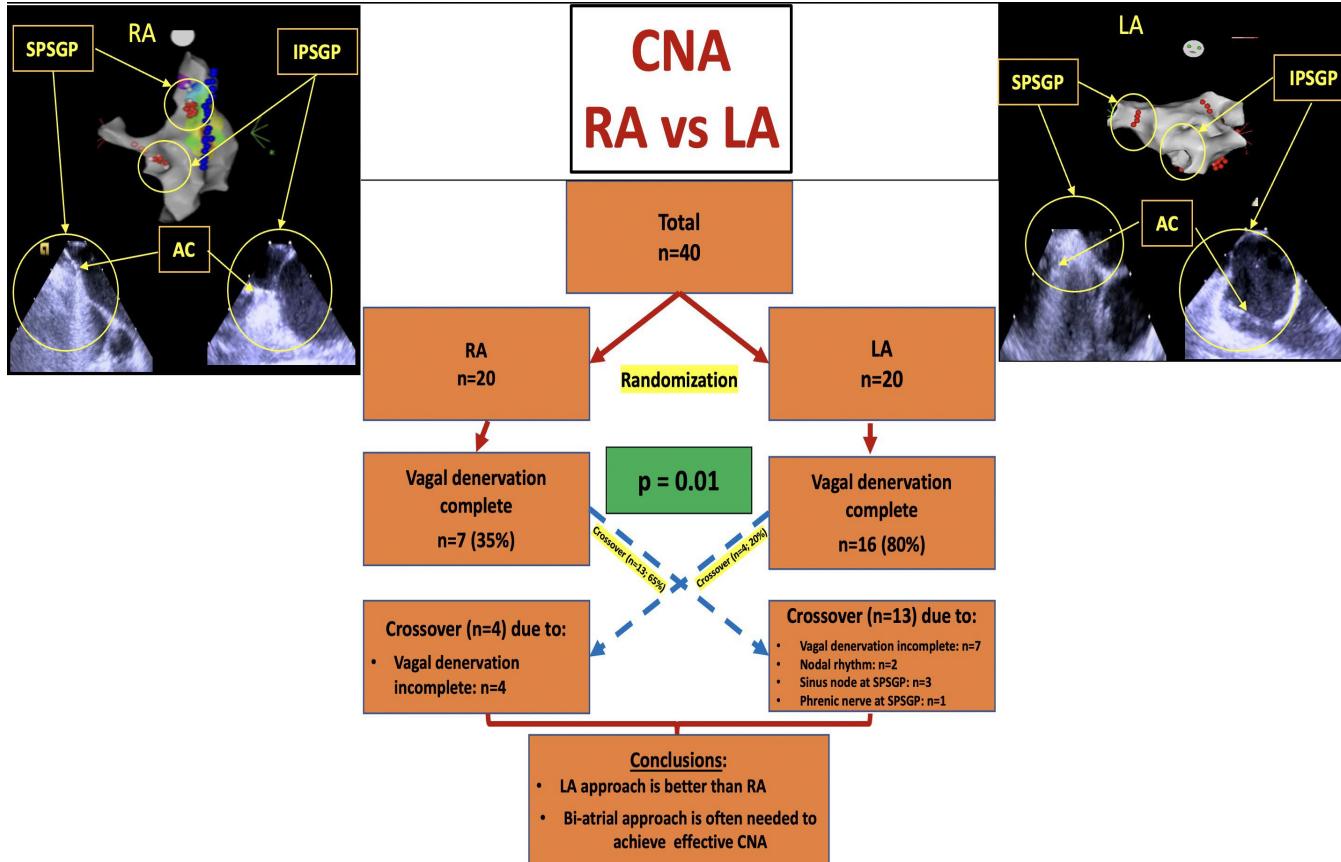

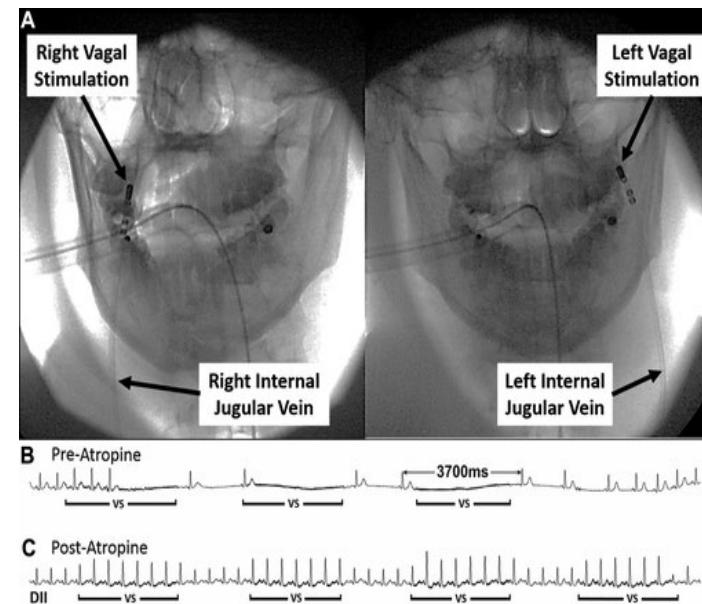

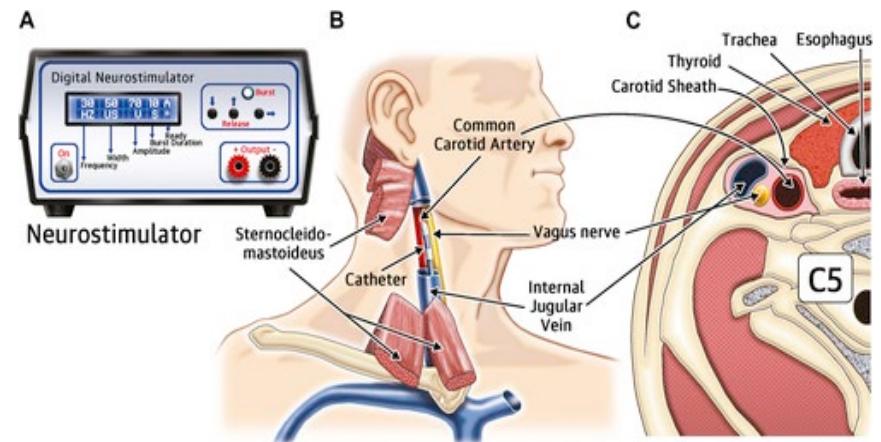

Table 1 Demographic, clinical, and procedural parameters in the whole study group and comparison between the RA and LA groups

Parameter	Total (n = 40)	RA group (n = 20)	LA group (n = 20)	P

AVB, atrioventricular block; ECG, electrocardiogram; SA, sinus arrest; VVS, vaso-vagal syncope.

CardioneuROablation: coMparison of acute effects of right versus left atrial Approach in patients with reflex syncope – ROMAN 2 study

- After including 40 patients, the study was stopped because total vagal denervation was achieved in significantly less patients from the RA vs. LA group.
- Of the RA group, in 13 (65%) patients, the primary endpoint was not achieved, and crossover to LA was necessary due to the inability to achieve full vagal denervation ($n = 7$, AVB in all patients)
- Of the LA group, crossover was needed in 4 (20%) patients due to the inability to achieve full vagal denervation (AVB in all patients; $P = 0.0095$, RA vs. LA group).
- LA or BiA approach resulted in a better mid-term outcome than the RA approach only.

Jose C. Pachon M. et al. J Am Coll Cardiol EP 2015; 1:451-460.

Cardioneuroablation for reflex asystolic syncope: Mid-term safety, efficacy, and patient's acceptance

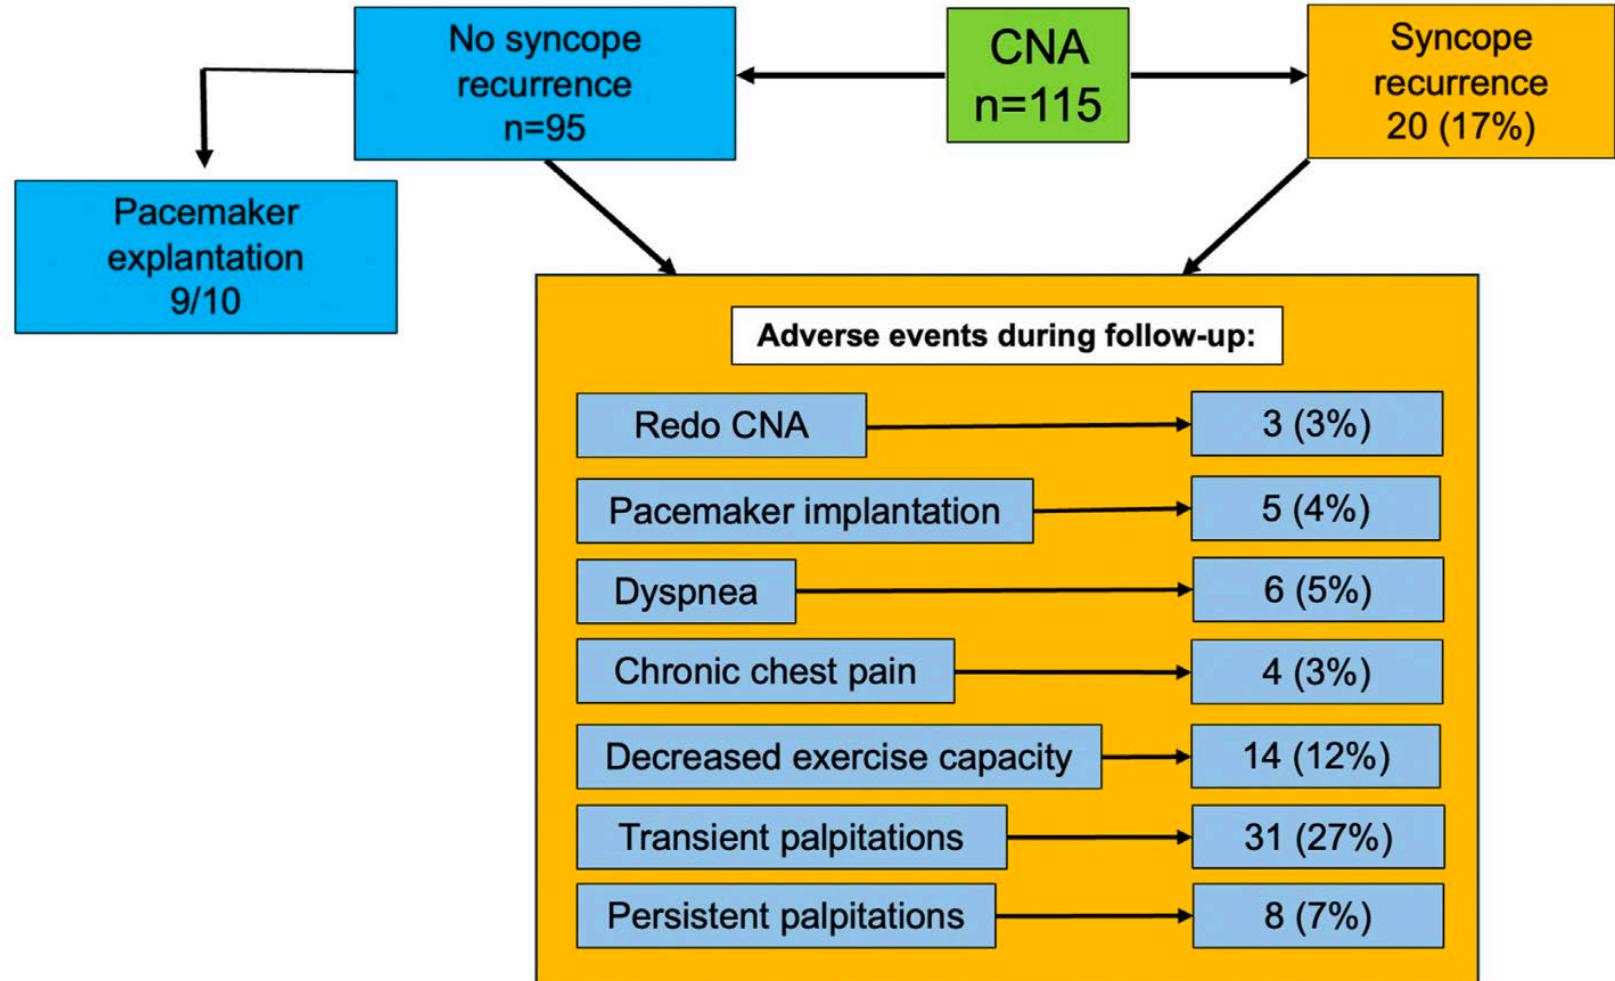

- Prospective observational single-center study
- 115 consecutive patients
- Between 2016 and 2022
- At least 1-year follow-up.

Table 1 Baseline demographic and clinical characteristics (n = 115)

Age (y)	39 ± 13
Female	67 (58)
ECG documentation of sinus pause or AVB	
Spontaneous	35 (30)
Tilt-induced	60 (52)
Both spontaneous and tilt-induced	20 (17)
ECG phenotype	
Functional sinus arrest >3 s or sinus bradycardia	80 (70)
Functional AVB	21 (18)
Both	14 (12)
Asystole (sinus arrest or AVB) duration (s)	10 (3–60)
Total no. of syncopal episodes before CNA	5 (1–150) [3–5]
No. of syncopal episodes before CNA over period equal to follow-up	3 (1–110) [2–10]
No. of syncopal episodes in the 1 year before CNA	2 (1–56) [1–4]
Injury associated with syncope	18 (16)
Previous treatment	
Nonpharmacologic	115 (100)

Midodrine	4 (3)
Fludrocortisone	2 (2)
PM implanted in the past	10 (9)
Previous qualification for PM but implantation not performed	59 (51)

Cardioneuroablation for reflex asystolic syncope: Mid-term safety, efficacy, and patient's acceptance

- Prospective observational single-center study
- 115 consecutive patients
- Between 2016 and 2022
- At least 1-year follow-up.

Cardioneuroablation for Treatment of Atrioventricular Block

Tolga Aksu , Rakesh Gopinathannair, Serdar Bozyel, Kivanc Yalin and Dhiraj Gupta

Originally published 1 Sep 2021 | <https://doi.org/10.1161/CIRCEP.121.010018> | Circulation: Arrhythmia and Electrophysiology. 2021;14

A stepwise protocol in 241 consecutive patients

Symptomatic AVB to identify **31 (12.9%) patients with functional AVB**

All patients had episode(s) of syncope in previous 12 months

AVB was persistent in 17 (54.8%) patients.

Results:

28 pts. received biatrial or left-sided cardioneuroablation

3 pts. received only right-sided cardioneuroablation because of structural factors

acute reversal of AVB and complete abolition of atropine response - in 30 (96.7%) cases
the remaining patient received a pacemaker.

mean follow-up of **19.3±15 months**

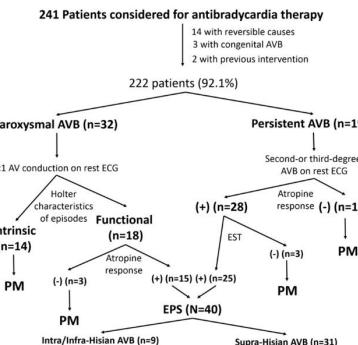

AVB episodes were observed in **2 (6.7%) of 30 cases**

3 (9.6%) patients required pacemaker implantation during follow-up.

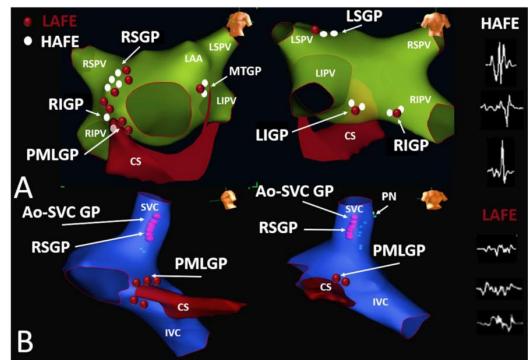

Conclusions:

Functional AVB can be identified in a minority of patients presenting with high-grade AVB. Cardioneuroablation for these patients results in encouraging medium-term outcomes.

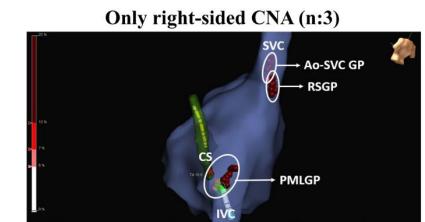

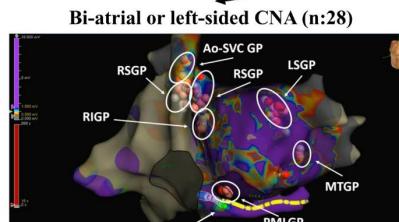

Selection of patients

Schematic view of ganglionated plexi distribution based on electrogram characteristics

Patients underwent two different CNA approaches based on the risk of transseptal puncture

Endpoints

Endpoint of RF lesion is unknown

increase HR

SNRT

Wenckebach point

elimination of electrograms

if fAVB – shortening of AH interval

**** Potential esophageal and phrenic nerve injury

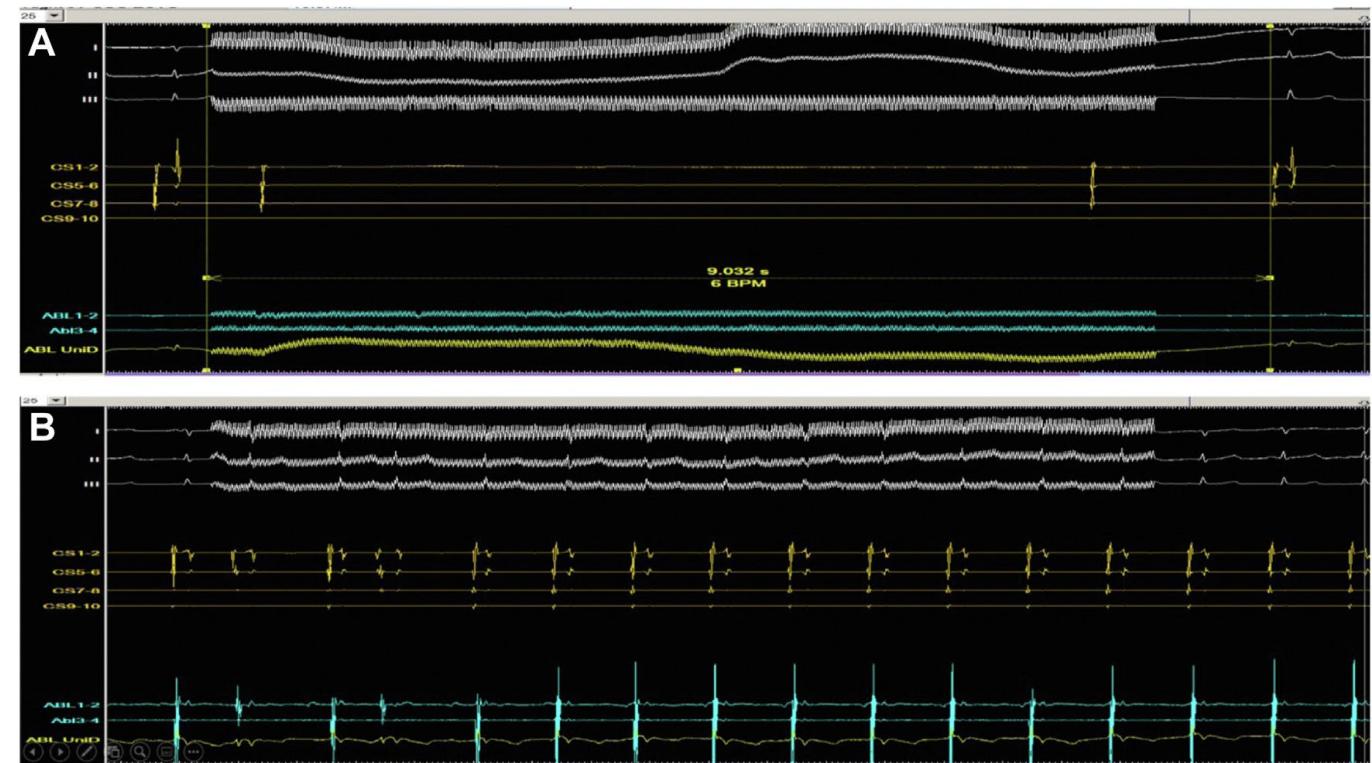

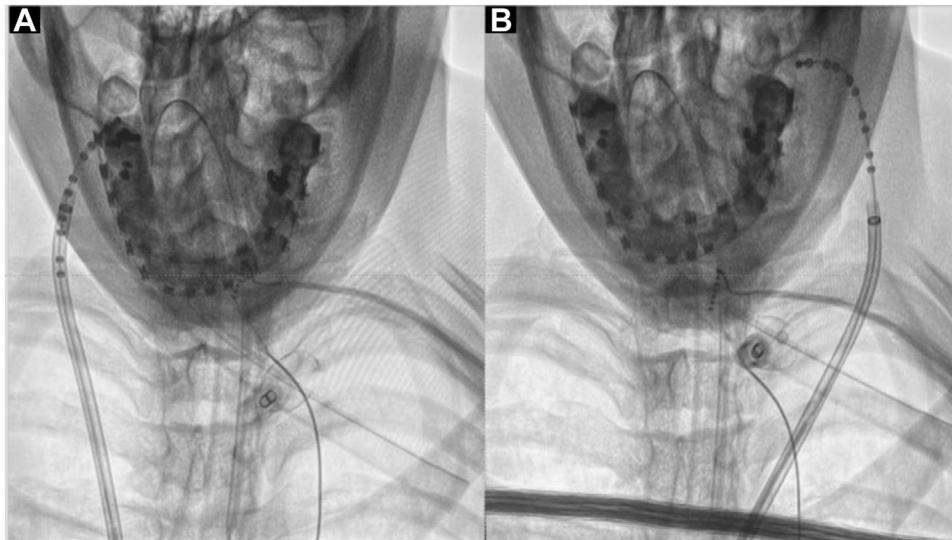

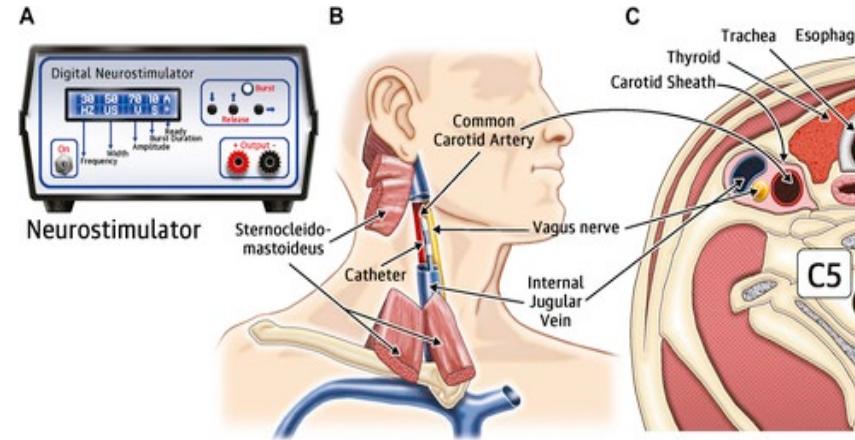

**** RF lesion should be intramural to reach effectively to the GP

**** loss of vagal protective effect

**** Arrhythmogenesis

Extra Cardial vagal Stimulation (ECVS)

No FDA/ CE mark approval
Need for general anesthesia

Long term safety of CNA???

The protective effects of vagal activity

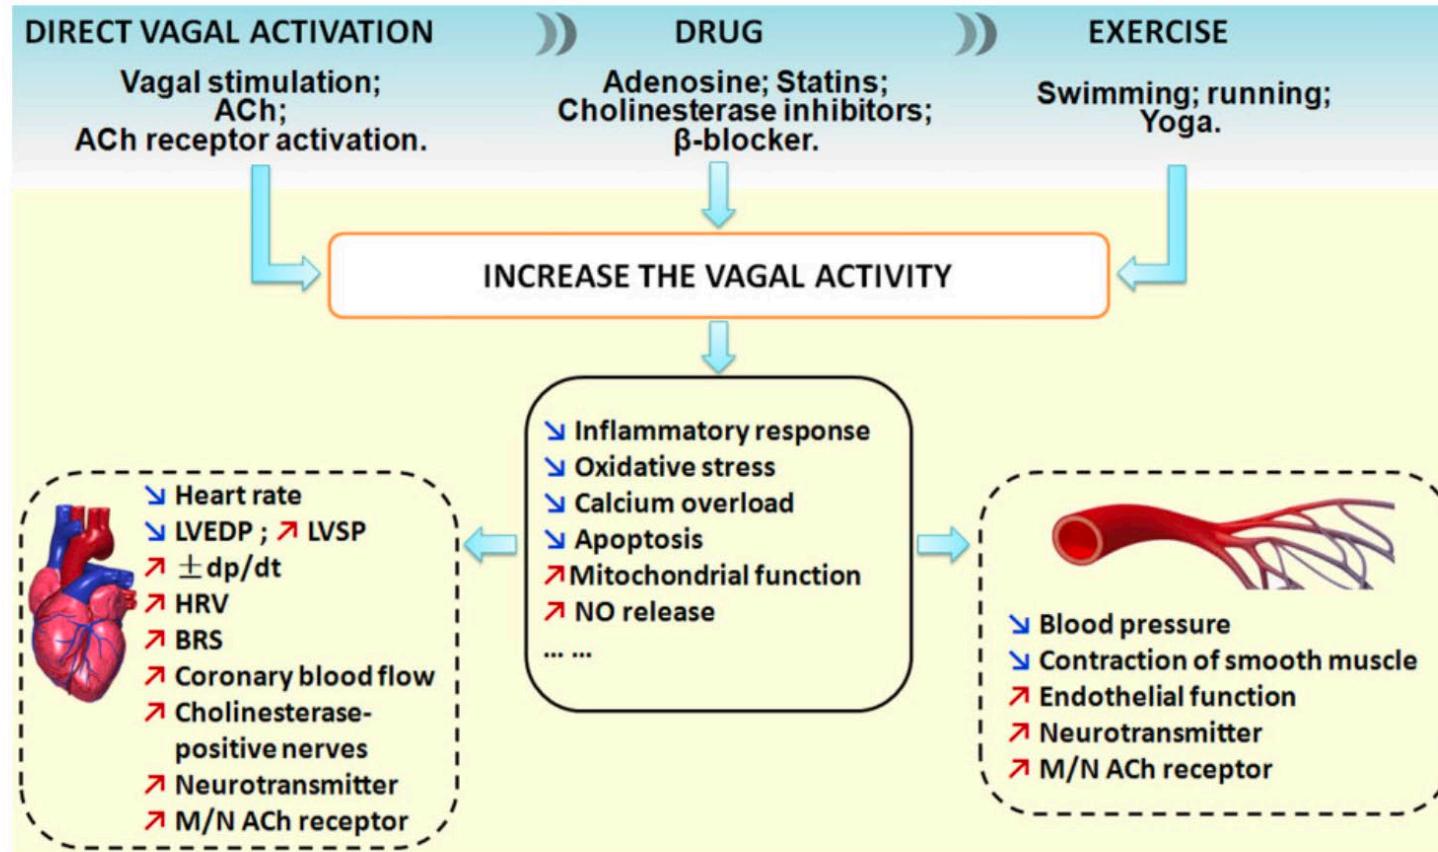

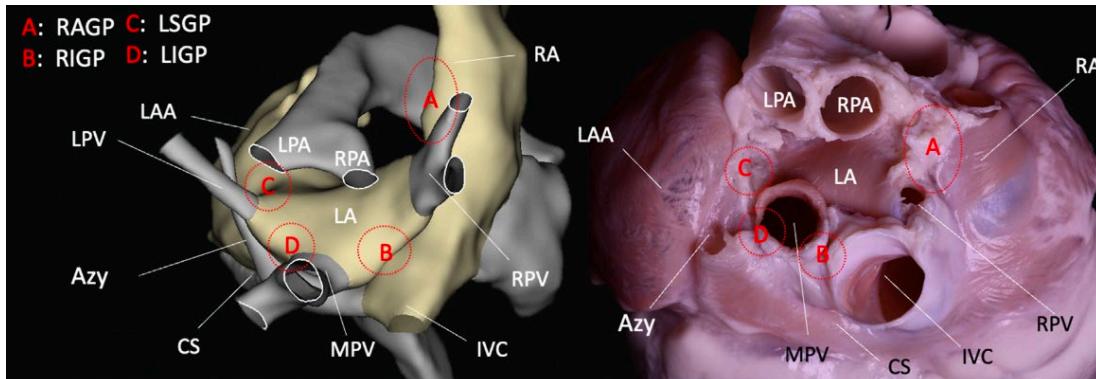

Figure 2

Beneficial effects on cardiac and vascular function are provided by the modulation of vagal activity, including direct vagal activation (vagal stimulation, ACh administration and ACh receptor activation), pharmacological modulation (adenosine, cholinesterase inhibitors, statins) and exercise training.

Is CNA pro-arrhythmic??

Pigs model

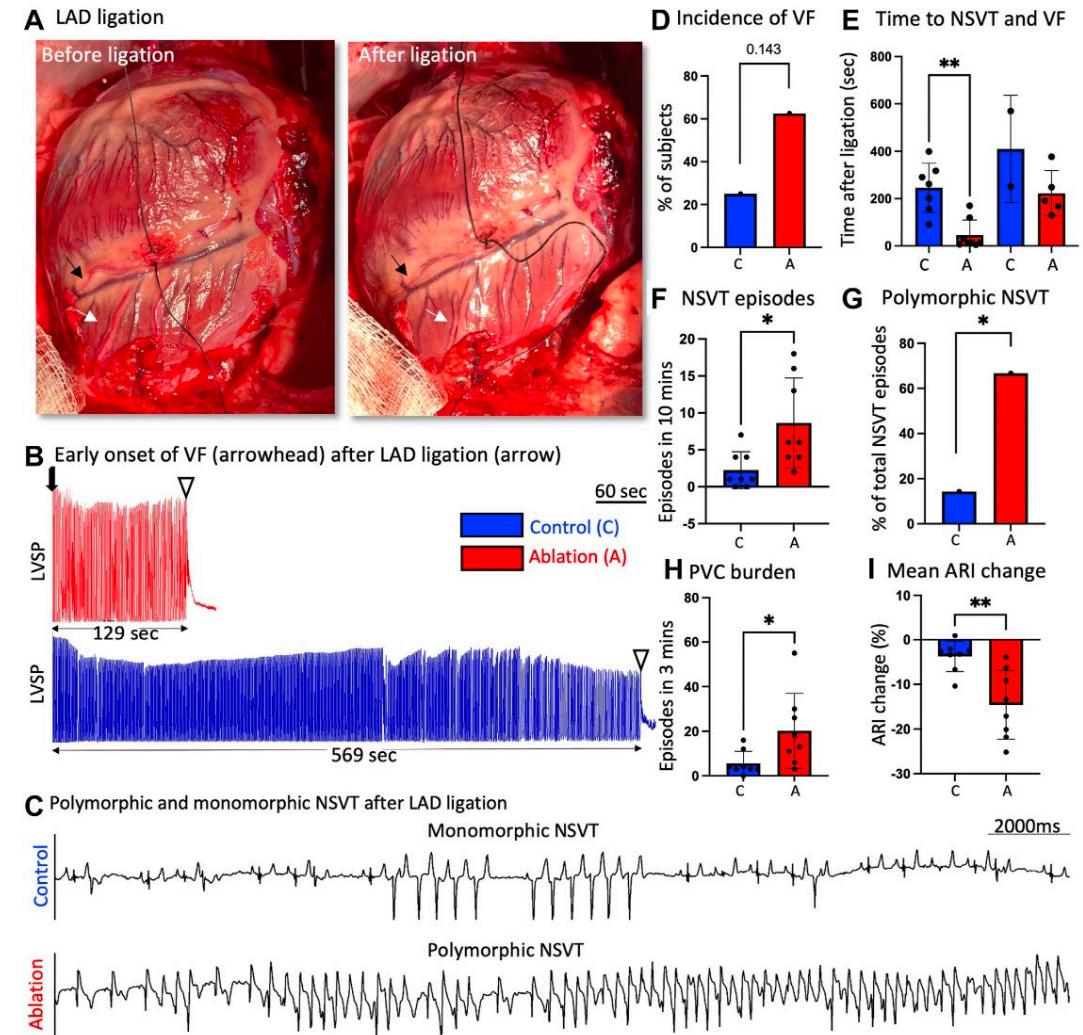

8 RA+LA CNA vs 8 Sham control

After 6 weeks - hemodynamic studies, Sym and ParaSym studies
+ proarrhythmic potential after LAD ligation.

Conclusions:

Cardiac vagal denervation is maintained long-term after CNA in a porcine model.

chronic CNA was associated with cardiovascular dysreflexia, diminished cardioprotective effects of cardiac vagal tone, and increased susceptibility to VT/VF in ischemia.

**לא תסמין או פאוזת בתקופת המקבב
שנתיים ו8 חודשים**

במבחן הטיה ממושך היום לא נצפתה עדות להיפוטנסיה אורתוסטטית. תגובה של דופק לעמידה תקין. בדקה 10 של העמידה הרגיש כאבים ולחץ העורף, בדקה 30-הרגיש עייפות, שלא לו בשניים המודינמיים משמעותיים. בחזרה לשכיבה הדופק חזר לרמה הבסיסית ומצבו השתפר.

לא נצפתה עדות להיפוטנסיה אורתוסטטית או הפרעה קרדיו-סימפטטית אחרת היום בבדיקה.

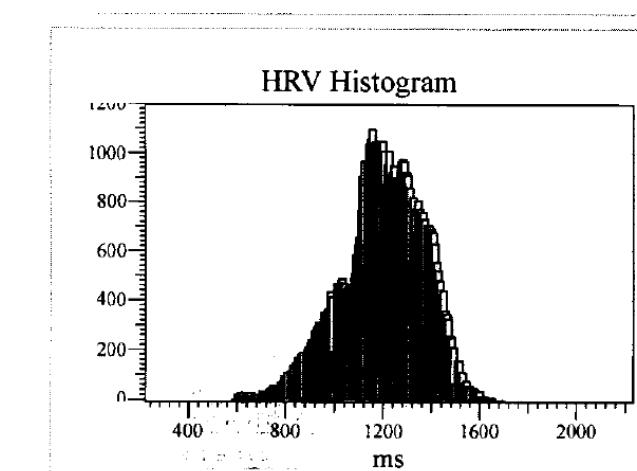

לוגמא 3

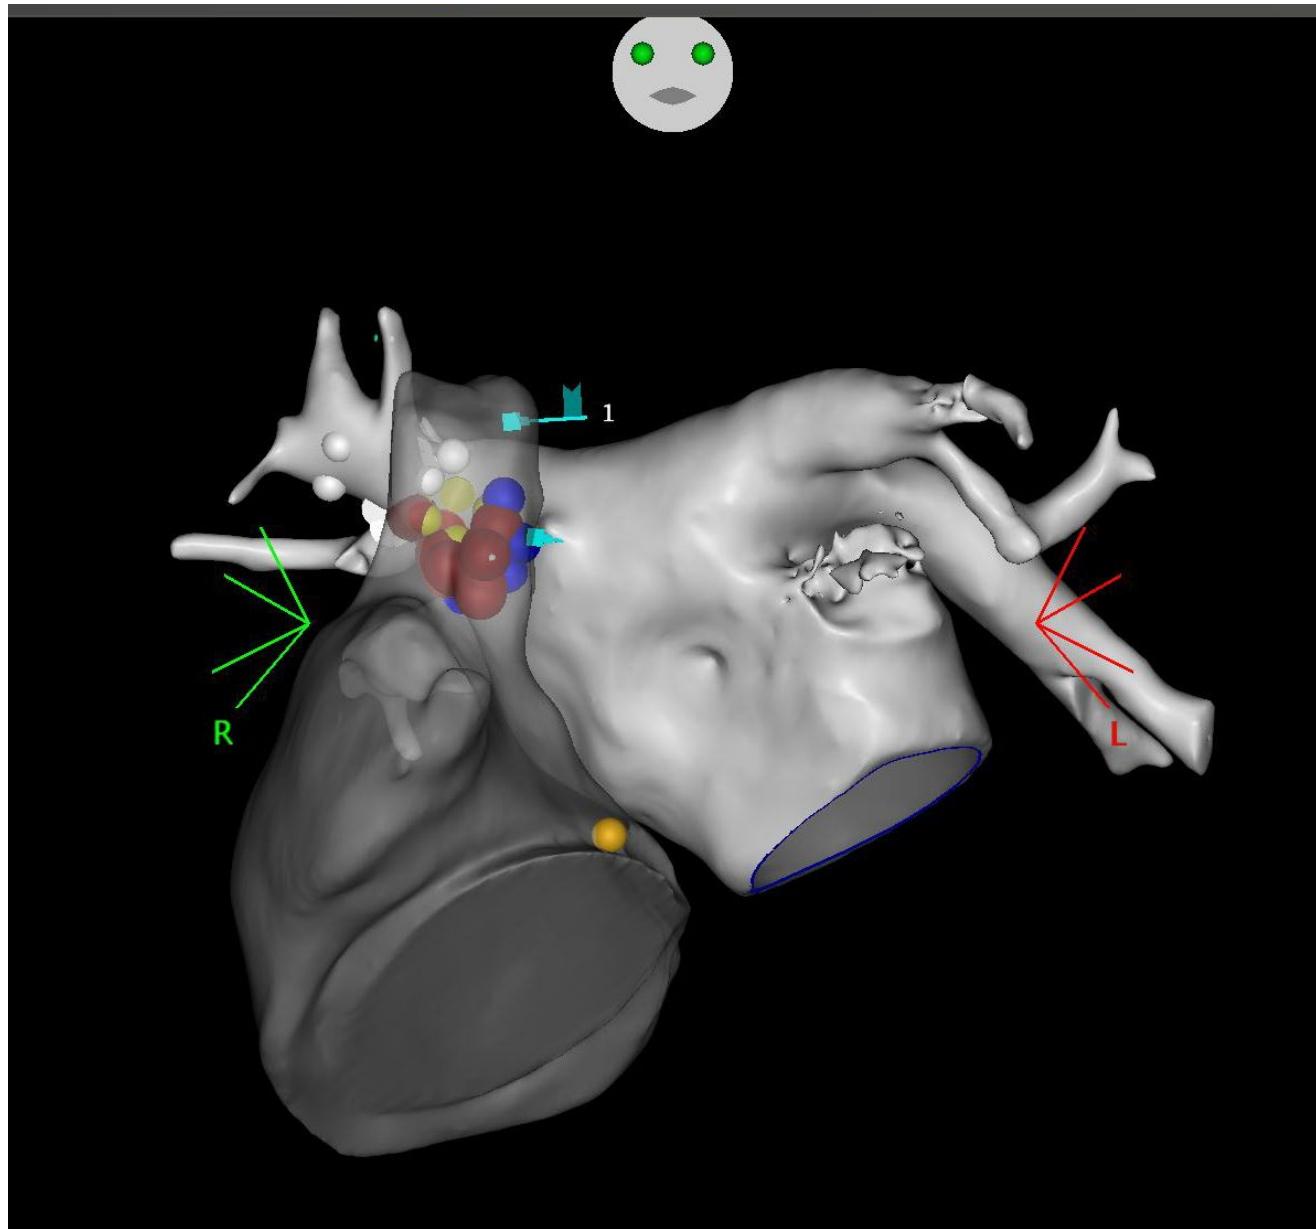

- בת 54 ברקע הפרעת חרדה ללא טיפול רפואי.
- עישון כבד בעבר – הפסיקה לעשן לפני כ-15 שנים.
- מזה שנים תחושת דופק איטי במנוחה, לעיתים סחרחות במנוחה. חולשה מתמשכת.
- כל התלונות חולפות במאז. מחמיר לאחר פעילות גופנית ממוצת.
- אקו לב תקין.
- בהולטר לב סינוס 38-123 ומקטעי RVAI במנוחה. דופק 38 בזמן ערות במהלך היום.
- ארגומטריה עם תגובה דופק טובת למאז והגעה עד 90 אחוז דופק מקסימלי ללא סימפטומים.
- בבדיקה אטרופין – דופק בסיסי 50 לדקה ולאחר מתן של 1 מ"ג אטרופין בלבד עליה עד סינוס 110.
- אוגוסט 2021 – צריבה של גנגליון פלקסוס.

No significant pauses since CNA - June 2023

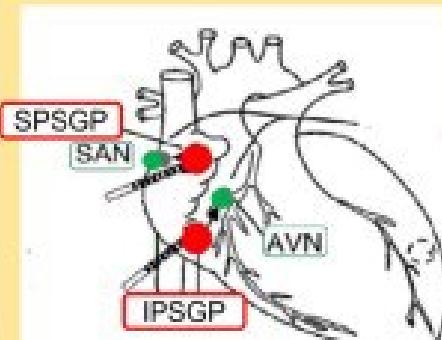

Cardioneuroblation for reflex syncope

What is known

Asystolic reflex syncope documented by:

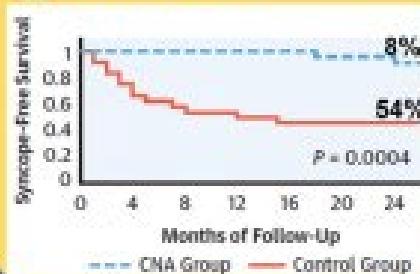

Target: SPSGP - IPSGP

At 2 years:

- ↓ Syncope recurrence
- ↓ Heart rate variability
- ↑ Heart rate

- Need for large RCTs
- Need for longer follow-up

What is not known

Less suitable in:

- Mixed forms
- Non-syncopal extrinsic SND/AVB

Do not perform in:

- VD forms
- Intrinsic SND/AVB

SPSGP only or SPSGP+IPSGP

- RA vs LA vs RA+LA
- Optimal ablation technique
- Assessment of acute procedural success

Long-term efficacy (reinnervation)

- Patient's expectation effect
- Physician's expectation effect
- Subgroup efficacy

Non-inferiority of CNA vs pacemaker in pts >40 yrs

Superiority of CNA vs conventional therapy in pts <60 years

Superiority of CNA vs sham CNA

Potential harm of long-term vagal denervation

Randomized studies reporting the impact of different treatment strategies on **quality of life** in vasovagal syncope

Study	Treatment	No. of patients	Follow-up	QoL measurement tool	Headline results
Sharma et al. [14] (LIVE-Yoga)	Yoga practice	55	12 months	WHO-QOL-BREF and SF-30	QoL at 12 months showed significant improvement of all Syncope Functional Status Questionnaire scores and 2 domains of WHO QOL-BREF scores ($P < 0.05$)
Perez-Lugones et al. [15]	Fluoxetine vs. bisoprolol	96	6 months	General evaluation of QoL from 1 (very good) to 5 (very bad)	Patients' well-being was improved only in the fluoxetine-group (13.4 ± 0.7 vs. 15.4 ± 0.9 before treatment, $P < 0.01$)
Piotrowski et al. [8]	CNA	48	3, 12, 24 months	QoL questionnaire University of Calgary	QoL improved substantially in patients who underwent CNA whereas QoL in the control group remained the same during follow-up
Baron-Esquivias et al. [3]	Cardiac pacing	54	24 months	SF-36	Mean SF-36 scores were higher in the DDD-CLS group vs. the DDI group for the eight subdomains. DDD-CLS benefited both MCS and PCS components with significant differences in PCS when compared with the DDI group

QoL quality of life, CNA cardioneuroablation, CLS closed-loop stimulation, MCS mental component score, PCS physical component score
