

# The Role of Echocardiography for the Diagnosis and Treatment of Prosthetic Valve Emergencies in the ICCU - Alik Sagie MD

**Alik Sagie MD, Echocardiographic Lab  
and Valvular clinic,  
Cardiology Department Rabin Medical  
Center, Israel**

# Prosthetic valve emergencies in the ICU

---

- Acute dysfunction of prosthetic valves may cause hemodynamic deterioration resulting in pulmonary edema or cardiogenic shock and should be considered in its differential diagnosis.

# Valvular emergencies in the ICU

---

- A rapid diagnosis of a valvular etiology in a patient with acute hemodynamic deterioration is very important because emergency interventions such as:
  - intensive medical therapy,
  - emergent valve replacement
  - new percutaneous valve procedurescan be effective, and, at times, life saving

# Diagnosis of PV Emergencies

---

- Clinical clues (from the patient's history, symptoms and signs) suggesting valvular etiology are very important but often difficult to get in patient in pulmonary edema or cardiogenic shock

# Diagnostic tools in prosthetic valve emergencies

---

- Therefore, echocardiography (TTE, TEE or 3D echo) is the best imaging modality to diagnose the etiology of acute hemodynamic deterioration and should be performed as soon as possible.
- This diagnostic tool can be done at bedside without the need to transfer the patient away from the intensive care setting to CT or MRI laboratory where monitoring of the patient is not ideal

# Bedside availability

---

---

# **TTE Vs. TEE in Prosthetic valve Emergencies**

# TTE in patients with prosthetic valve malfunction

---

- TTE is safe and fast in identifies **MANY** of cardiac causes of a shock or pulmonary edema in a critically ill patient in the ICU, **however**, in case of **prosthetic valve malfunction** especially in mechanical valves it is limited due to many artifacts and usually TEE is needed to complete the study

# TEE Advantages

---

- TEE has the following **advantages** over TTE:
  - Patients on respirators
  - Post-cardiac surgery patients
- **Better diagnostic capabilities and definition in:**
  - **Prosthetic valve complications**
  - **Acute IE**
  - **Acute MR and AR**
  - Aortic dissection and mural hematoma
  - Pulmonary emboli

# Disadvantages of TEE in critical ill patients in the CCU

---

- It requires **sedation**, which may compromise the borderline respiratory and hemodynamic status of the critically ill patient.
- **TEE-related complications (rare):**
  - aspiration pneumonia,
  - esophageal injury
  - Bronchospasm
  - Dislodgment of endotracheal tube
  - Unsafe in severe coagulopathy
  - Difficult to conduct in facial trauma

# Limitations of 2D TTE/ TEE

---

- Analysis of complex anatomic structures
- Spatial orientation
- Relationship between structures and devices

# Advantages of real time 3D TEE

---

- Real time 3D visualization of cardiac anatomy without any reconstruction
- Getting surgical views of the valves
- Enhanced analysis of the relationship between cardiac structures and devices
- Improvement in guidance of complex procedures

# PV Emergencies in ICCU

## Aortic prosthesis

---

- **Prosthetic valve regurgitation**
  - Endocarditis
  - Degenerated biologic valves
  - Stuck mechanical valve
  - Severe paravalvular leak
- **Prosthetic valve stenosis –stuck valve**
  - Valve thrombosis
  - Valve Pannus
  - Endocarditis

# Acute aortic valve prosthesis regurgitation

**TABLE II.** Comparison of Findings in Severe Acute and Chronic Aortic Regurgitation

Variable	Aortic Regurgitation	
	Acute	Chronic
<b>Auscultatory</b>		
Diastolic murmur	Soft, early	Holodiastolic, decrescendo
S <sub>1</sub>	Soft	Normal or diminished
S <sub>2</sub>	Loud P <sub>2</sub>	Normal
S <sub>3</sub>	Present	Absent
<b>Hemodynamic</b>		
Cardiac output	Decreased	Normal
Pulse pressure	Normal or decreased	Increased
Systolic pressure	Decreased	Increased
LVEDP	Severely increased	Normal
Left ventricular size	Normal	Increased

# Echocardiographic evaluation of AR

## AR - regurgitant jet

---

# Aortic regurgitation severity

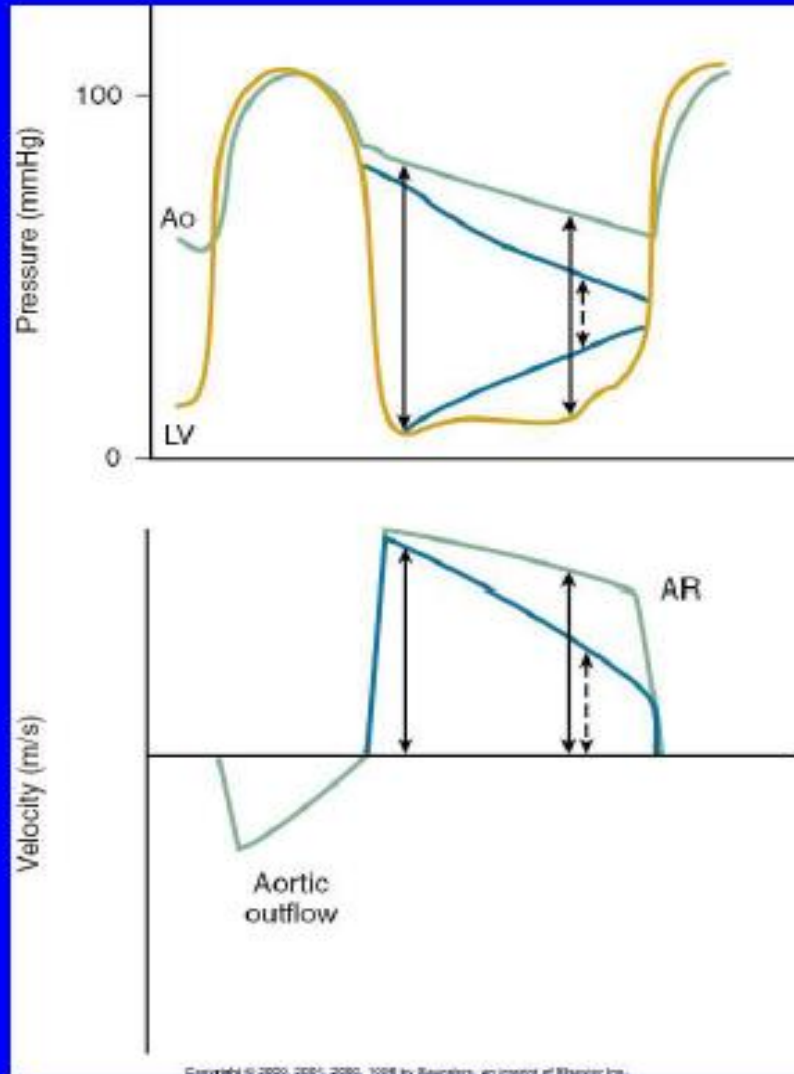

---

	<b>Mild</b>	<b>Moderate</b>	<b>Severe</b>
<b>Angio</b>	1 +	2+	3-4+
<b>Doppler jet area</b>	<25% LVOT	25% - 65%	>65%
<b>Vena Con</b>	< 3 mm	3-6 mm	>6mm
<b>Reg Vol</b>	<30 ml	30 -60 ml	>60 ml
<b>ERO cm<sup>2</sup></b>	< 0.1	0.1- 0.29	> 0.3

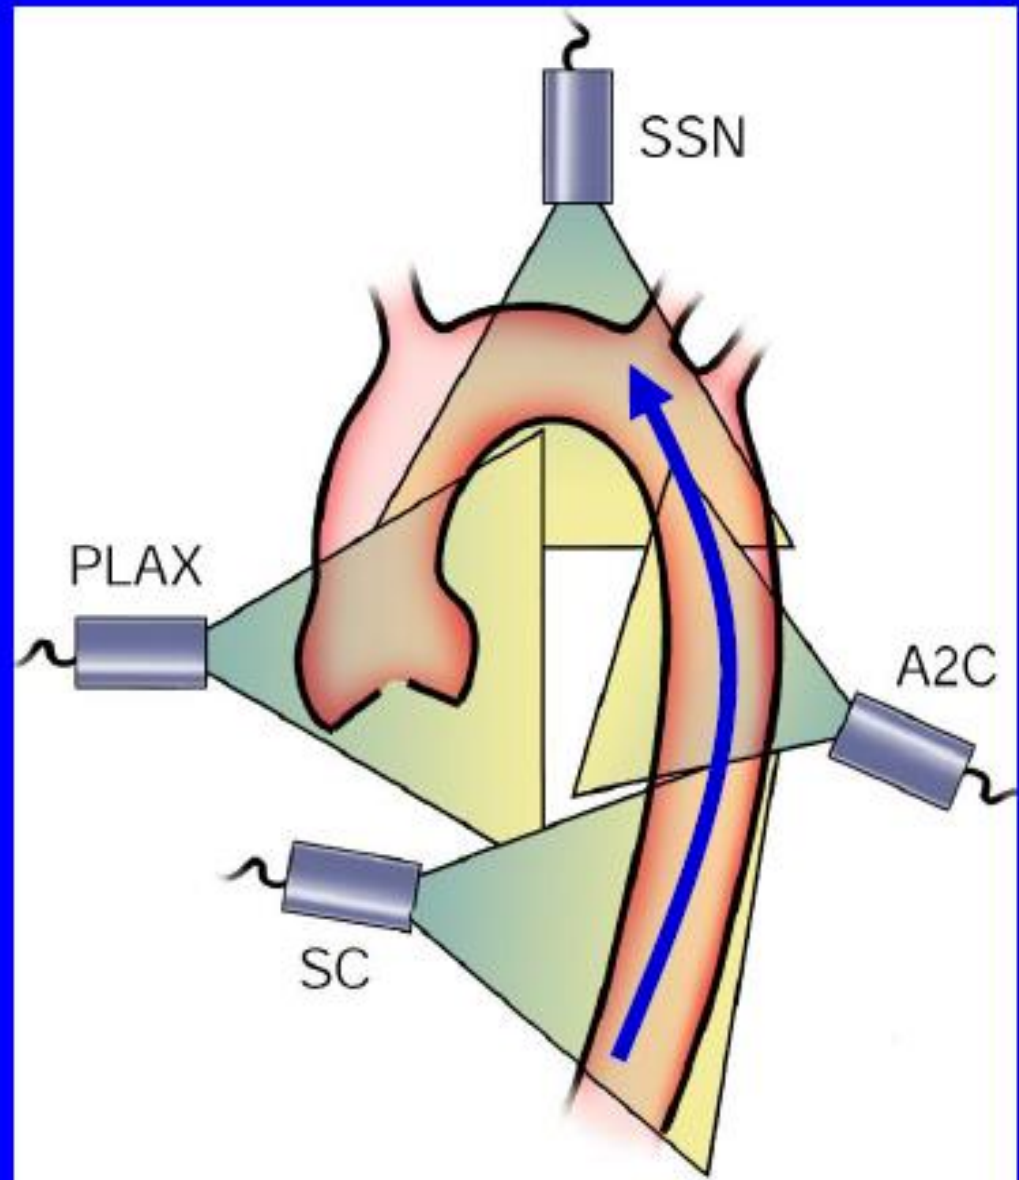

# Premature mitral valve closure in acute aortic regurgitation by M-mode echo

# Valve hemodynamics: Acute vs. Chronic AR

# Holo-diastolic flow reversal in the distal aorta

# Clinical examples

---

# Acute AR due to degenerated xenograft

---

- A 76 old man underwent AVR- xenograft 11 years ago
- Admitted to the ICCU with Pulmonary edema and hypotension
- History of significant **COPD**
- 6 month before index hospitalization routine echocardiogram reveal moderate AR due to degenerated xenograft and he was clinically stable at that time

# TTE

DD: Acute AR due to Degenerated valve with mobile torn leaflets  
Acute AR due to IE with mobile vegetations

# 2D –TEE – Severe AR

**VC= 9 mm**

# Doppler trace of acute AR

# Follow up

---

- The patient was referred to emergent AVR (within 24 Hr) and recovered slowly after long hospitalization due to respiratory complications
- Today in the era of percutaneous valve interventions “transfemoral “Valve in Valve” implantation could be a good alternative in an elderly patient with severe COPD

# Lesson

---

- When a patient with bioprosthesis develops bioprosthesis malfunction degeneration, the natural history is unpredictable and it's better to plan an elective operation earlier rather than waiting for acute emergency such as happened in this patient

# An elderly patient with mechanical prosthesis who presents to the ICCU with pulmonary edema and hemolysis

**DD:**  
Intravalvular  
vs.  
Perivalvular  
leak

# 3D TEE COLOR FLOW

# Percutaneous paravalvular leak closure

## First device in place- residual AR

---

# Residual AR after first device by color TEE

# Catheter in second paravalvular hole

---

# 2 devices in place by 2D color flow TEE

# Acute STEMI in a patient after AVR

---

- 52 years old woman with coronary risk factors
- 7 years ago she underwent AVR – bileaflet SJ mechanical prosthesis.
- She was admitted with typical angina and ECG consisted with anterior wall STEMI
- Coumadin therapy was interrupted for several days due to small surgery
- LAB results: troponin 0.6; CPK-440; INR 2.1

# ECG on presentation

RBBB +  
ST elevation  
V3-V6

# Cardiac Catheterization

---

# 2D transgastric TEE

# Prosthetic gradients on TEE

## Prosthetic gradients

Peak = 78  
mean = 45  
mmHg

# 3D TEE

# 3D TEE

# Fluoroscopy

# Treatment option

---

- Redo AVR
- High dose heparin
- Thrombolysis

# Follow -up

---

- Initially high dose heparin was given with PTT over 80 second – no improvement in leaflets motions
- Thrombolytic treatment was than given – TPA 100 mg within 3 hours
- After 1 hour the patient developed severe chest pain
- On ECG ST elevation on inferior wall leads

# ECG during thrombolytic therapy and chest pain

ST elevation  
inferior wall  
leads

## Follow – up

---

- Thrombolytic therapy continued with the rationale that the ischemic episode is due to emboli released from the prosthesis to obstruct RCA\CX artery.
- After completing thrombolysis treatment chest pain subsided and ST elevation resolved

# ECG post thrombolysis

ST elevation  
Resolved

# Fluoroscopy post thrombolysis

---

# Acute aortic bio-prosthesis obstruction due to infective endocarditis

---

- A 64 yrs old patient with was admitted to the ICCU with shortness of breath and high fever
- He underwent AVR (xenograft) **a year ago.**

# TEE

DD: Large obstructive vegetation  
Large obstructive thrombus

# Doppler TEE

**PG = 87 mmHg**  
**MG = 60 mmHg**

# Clinical course

---

- Blood cultures revealed gram positive bacilli
- **Endocarditis** causing severe prosthetic valve stenosis was diagnosed.
- IV Antibiotics were started
- The patient was scheduled to surgery after the weekend since he was hemodynamically stable and it was felt by the surgeon that 3 days of IV antibiotics before surgery are important.

## Follow-up

---

- 1 day later the patient suddenly developed shortness of breath cardiogenic shock and died

# Lesson

---

- Biological valve obstruction due to large mass of infectious material is a **true emergency** situation (like stuck mechanical valve). Surgery should be performed immediately.

# Emergent valve in valve implantation in a patients severe prosthetic valve stenosis

---

- A 88 years old woman.
- S/P CABG X 2 and AVR -bioprosthesis 9 years ago
- Admitted because of intractable HF

# TEE of degenerated bioprosthesis stenosis

PG = 67 mmHg  
MG = 42 mmHg

# Contrast injection after Core valve implantation

---

# Summary

---

- **Echocardiography** is the imaging tool of choice for diagnosing valvular emergencies in the CCU
- **TTE** is usually enough to diagnose the main reason for the patients hemodynamic deterioration

# Summary

---

- **TEE** has a better diagnostic capabilities especially in patients on respirator or post cardiac surgery and in special clinical setting such as prosthetic valve complications and SBE
- **Real time 3D TEE** is a new tool that has some advantages for diagnosis of complex pathologies and monitoring interventions but its added value especially in the ICCU setting is still need to be evaluated

# Summary

---

- Since surgical mortality rates remain high, new interventions such as:
- **Thrombolysis** in stuck mechanical valve
- **Valve in valve** implantation in degenerated bioprosthesis or
- **Percutaneous closure** of severe AR due to paravalvular leaks

**May be a good alternative in selected cases**

# Thank you

# Valvular Emergencies in ICCU

## Prosthetic Mitral Valve

---

- **Acute Prosthesis regurgitation**
  - Endocarditis
  - Degenerated biologic valves
  - Stuck mechanical valve
  - Severe paravalvular leak
  
- **Prosthetic stenosis –stuck valve**
  - Valve thrombosis
  - Valve Pannus
  - Endocarditis

# Prosthetic valve Regurgitation

---

Intra valvular  
regurgitation in  
mitral bio-prosthesis

# Case history

---

- A 50 years old women with RHD after 4 valve replacements surgery (redo MVR + TVR).
- Last operation was MVR 12 years ago and a bioprosthesis was implanted
- She was admitted with pulmonary edema

# 2D TEE

# Real time 3D TEE

# Valve in valve implantation

---

# Live 3D echo during procedure

# TEE during valve implantation

# Balloon expandable valve implantation

---

# Color TEE after valve in valve implantation

# TEE post valve in valve implantation

# 3D TEE- POST

## FOLLOW -UP

---

- The patient went home after 3 days
- 2 years after the procedure she is in FC 1
