**DISCLOSURE**  
**NONE**

# Caloric restriction

- ❑ **life span**

Extends longevity in numerous species including mammals

- ❑ Delays the onset of age-related pathologies including cardiovascular diseases

- ❑ Increases the resistance against ischemic injury in the heart of laboratory animals

# The $\alpha$ MUPA transgenic model

$\alpha$ MUPA mice spontaneously consume less food (~20%) compared to wild-type (WT)

**A**

= 18 months

**B**

-Reduced body weight - Increased life span - Improved health

# Objectives

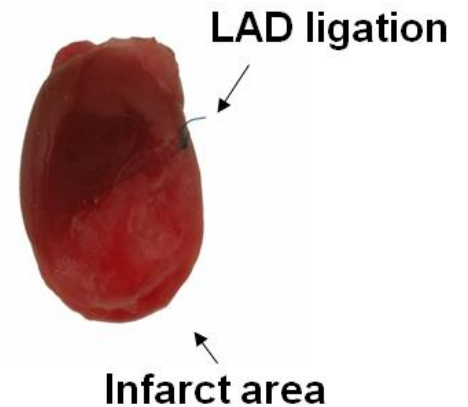

We aim to:

- ❑ Test whether  $\alpha$ MUPA, as CR mice, demonstrate improved heart recovery following MI compared to WT.
- ❑ Investigate the possible factors in  $\alpha$ MUPA hearts that lead to cardioprotection against ischemic damage.

# Methods

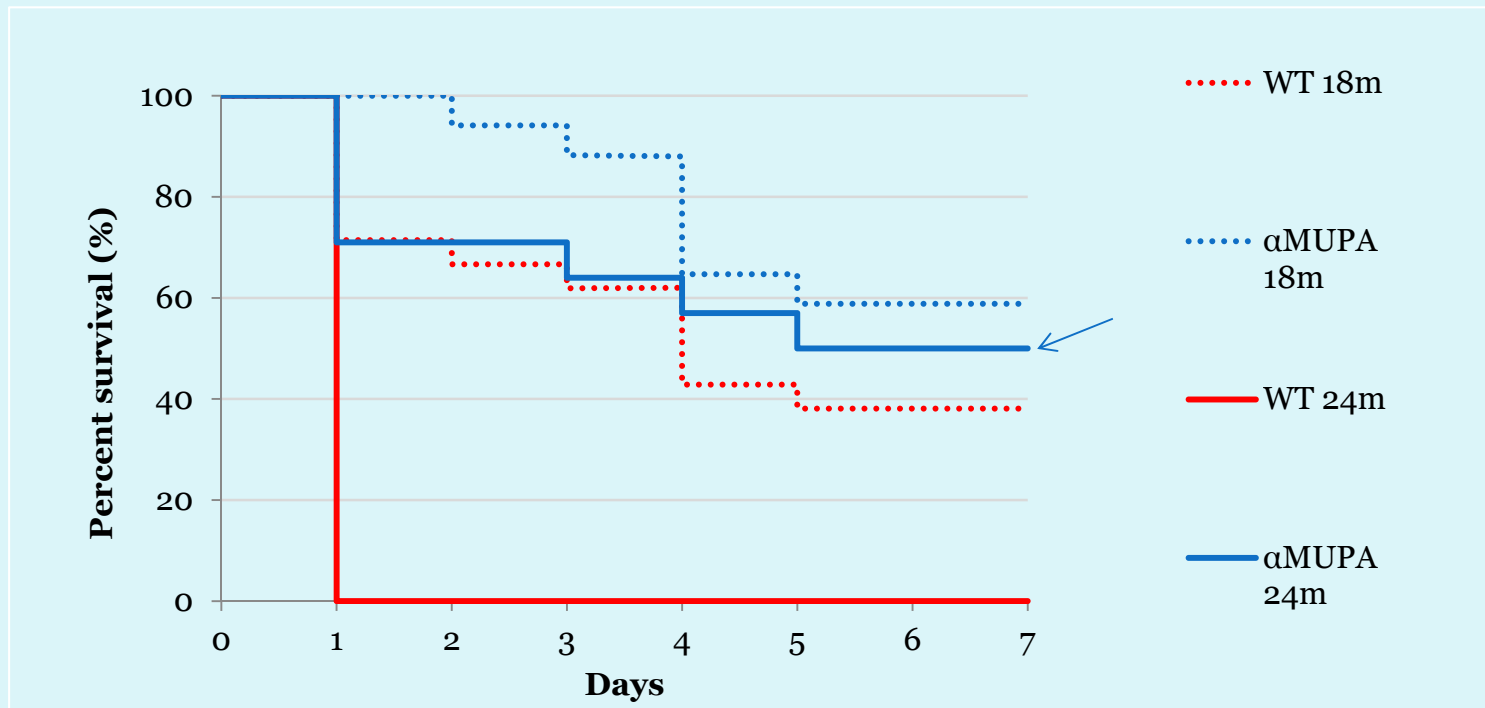

- ❑ **Group**  
young and old  $\alpha$ MUPA and WT mice
- ❑ **Surgery**  
Ligation of left anterior descending (LAD)  
coronary artery of
- ❑ **Echocardiography**
- ❑ **Histological analysis**
- ❑ **ELISA**
- ❑ **Western blot**

# Results - Increased survival

*A Kaplan–Meier survival plot  
for  $\alpha$ MUPA and WT mice after LAD ligation at different ages*

Survival was monitored for one week. (Kaplan-Meier,  $P < 0.01$ )  $n=10-20$

# Improved heart function

*Fractional shortening, 24h following myocardial infarction*

\*p<0.05 αMUPA compared to WT mice, ~p<0.05 sham compared to MI, n=6-8/group.

# Heart pathology – reduced infarct size

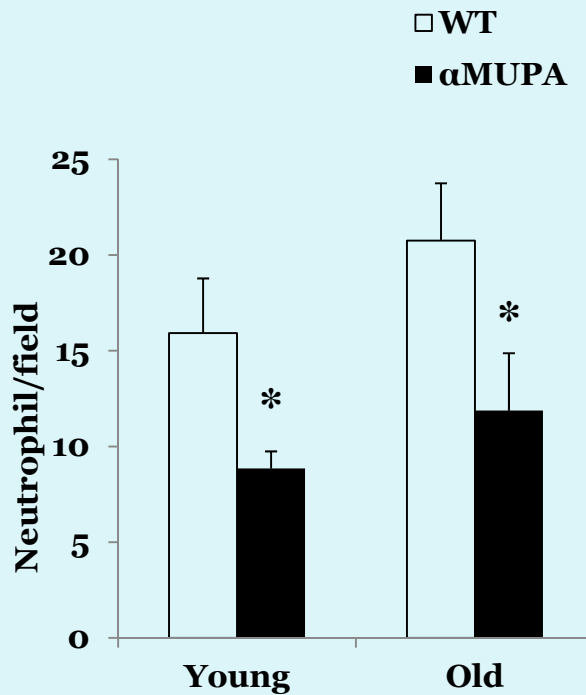

TTC staining, 24h following myocardial infarction.

\* $p < 0.05$  αMUPA compared to WT mice,  $n = 6-8$ /group.

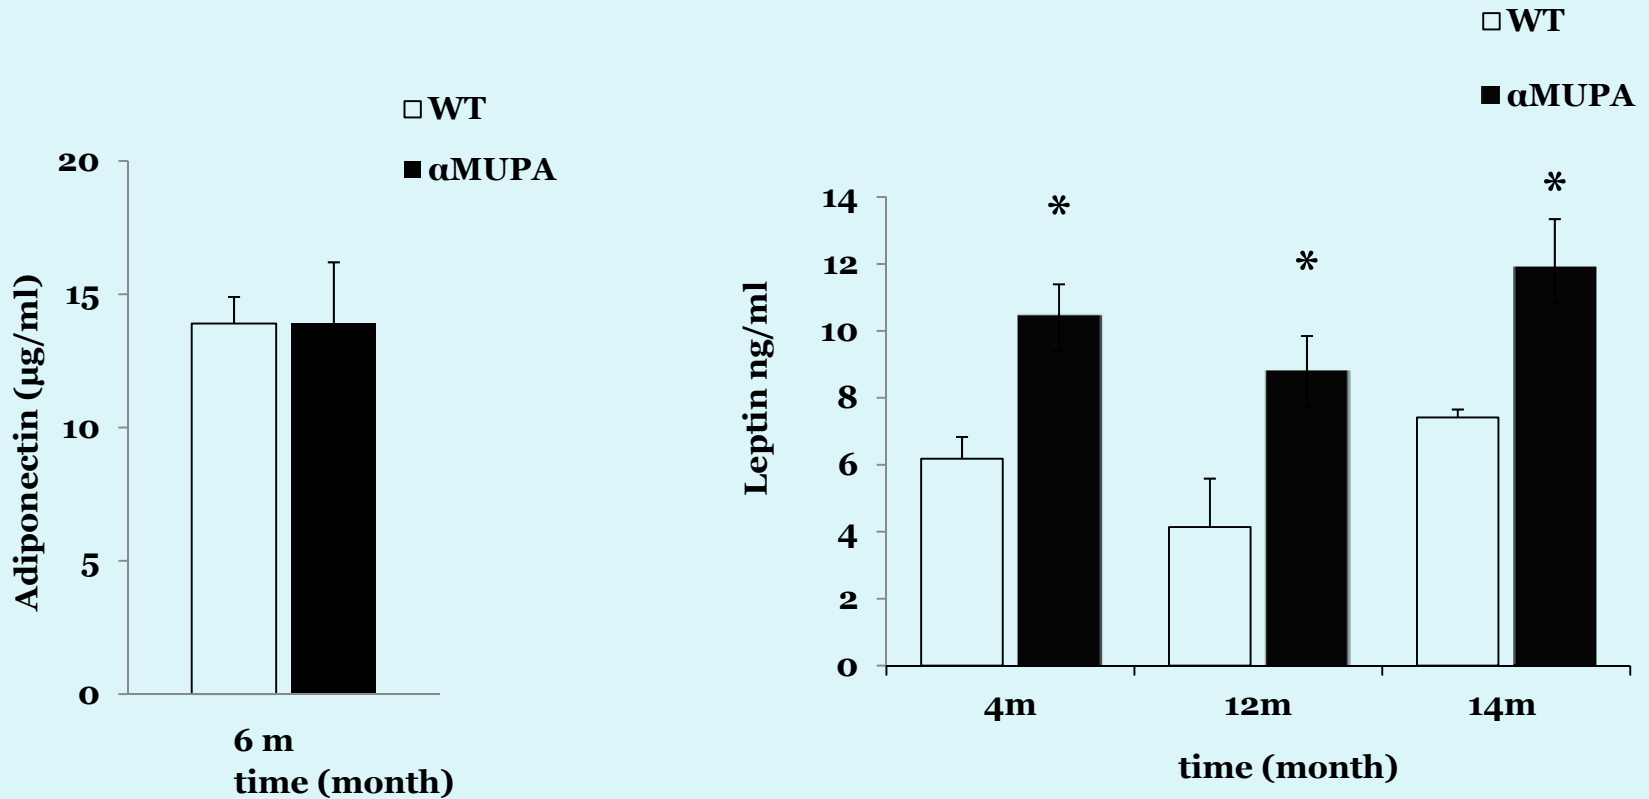

# Heart pathology – reduced inflammation

## Neutrophil infiltration, 24h following myocardial infarction

\* $p < 0.05$  αMUPA compared to WT mice,  $n = 4$ /group.

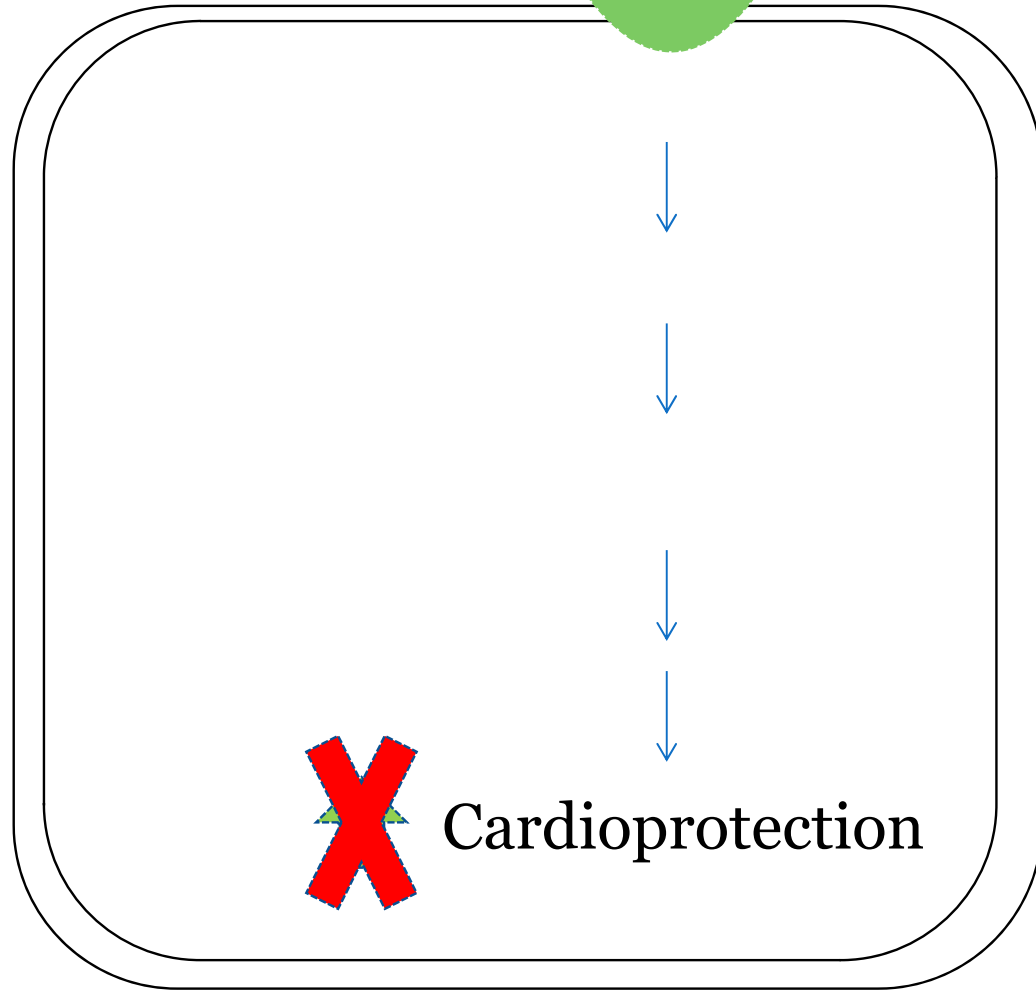

# Adiponectin & Leptin

\* $p < 0.05$  αMUPA compared to WT mice ,  $n = 6$ /group.

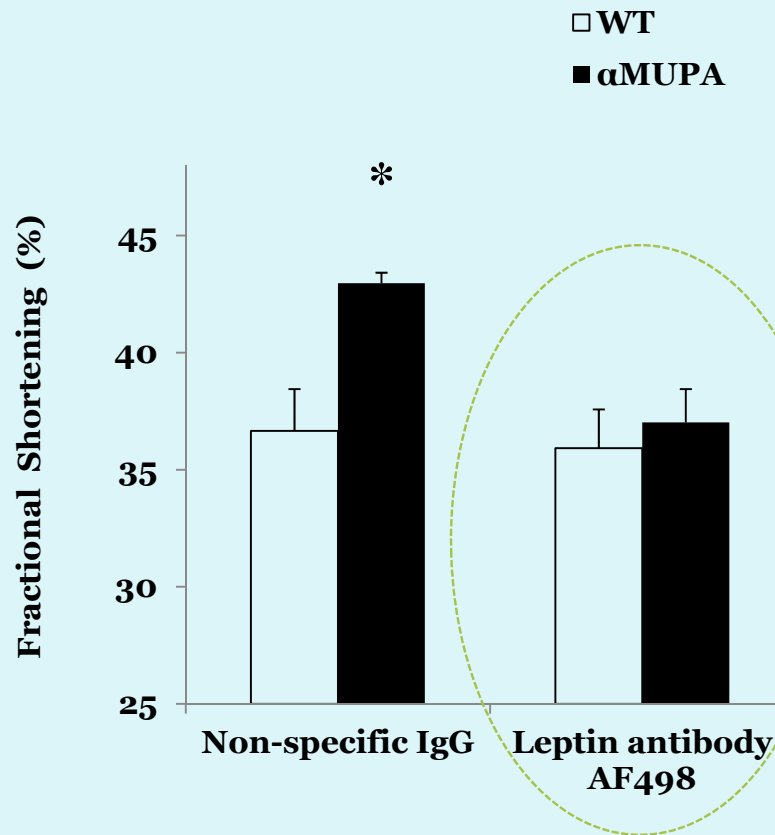

**Leptin**

**IV injection of antibodies against leptin (AF498)**

# The leptin neutralizing antibody abrogates cardioprotection

\*p<0.05 αMUPA compared to WT mice, n=5-8/group.

# AKT activation

- Metabolism
- Cell survival

\* $p < 0.05$  pAKT levels  $\alpha$ MUPA compared to WT mice,  $n=6$ /group

**AG490** JAK ---- p-JAK

**WORTMANNIN** PI3K ---- p-PI3K

AKT ---- p-AKT

Cardioprotection

IP injection of JAK or PI3K inhibitor (**AG490** OR **Wortmannin**)

# Summary

- ❑  $\alpha$ MUPA resemble CR mice and show increased cardioprotection and attenuated heart ageing.
- ❑ Leptin is involved in  $\alpha$ MUPA cardioprotection by activating AKT.
